Part B: Fund Specific Information

Simplified Prospectus dated July 15, 2025

Alternative Funds

CI Bitcoin Fund (Series A, AH, F, FH, I, IH, P and PH units)

CI Ethereum Fund (Series A, AH, F, FH, I, IH, P and PH units)

CI Solana Fund (Series A, AH, F, FH, I, IH, P and PH units)

(each, a “**Crypto Mutual Fund**” and collectively, the “**Crypto Mutual Funds**”)

CI Galaxy Bitcoin ETF (ETF US\$ Series, ETF C\$ Unhedged Series and ETF C\$ Hedged Series units)

CI Galaxy Ethereum ETF (ETF US\$ Series, ETF C\$ Unhedged Series and ETF C\$ Hedged Series units)

(each, a “**Crypto ETF**” and collectively, the “**Crypto ETFs**”)

CI Galaxy Core Multi-Crypto ETF (ETF US\$ Series, ETF C\$ Unhedged Series and ETF C\$ Hedged Series units)

CI Galaxy Multi-Crypto Navigator ETF (*formerly CI Galaxy Multi-Crypto ETF*) (ETF US\$ Series, ETF C\$ Unhedged Series and ETF C\$ Hedged Series units)

(each, a “**Multi-Crypto ETF**” and collectively, the “**Multi-Crypto ETFs**” and together with the Crypto ETFs and the Crypto Mutual Funds, the “**Funds**”. The Crypto ETFs and the Multi-Crypto ETFs shall be referred to as the “**ETFs**”).

Introduction to Part B of the Simplified Prospectus

Part B of the simplified prospectus provides specific information about each Fund as set out on the cover page and should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. The first section of Part B of the simplified prospectus provides information that is applicable or shared amongst the Funds, including an overview of a mutual fund, the types of risks investors should be aware of when investing in a Fund, investment strategies and restrictions, material attributes and characteristics of the Fund securities offered, history of the Funds and the Funds' investment risk classification methodology.

Some Terms Used in this Simplified Prospectus

We have written this document in plain language, but this simplified prospectus includes financial terms that may be new to you. This section explains a number of these terms.

Bonds - fixed income securities issued by governments and corporations to finance their operations or pay for major projects. When you buy a bond you are in effect lending money to the issuer. In return you receive interest payments and the face amount of the bond on a future date called the maturity date.

CIBC Mellon Custodian - refers to CIBC Mellon Trust Company as the custodian of the Funds, except in the case of the Galaxy Bitcoin ETF and CI Galaxy Ethereum ETF.

Cidel Custodian - refers to Cidel Trust Company as the custodian of CI Galaxy Bitcoin ETF and CI Galaxy Ethereum ETF.

Custodians - refers to CIBC Mellon Custodian and Cidel Custodian.

Digital Asset or Digital Assets - means BTC, ETH and/or SOL. In respect of CI Bitcoin Fund/CI Galaxy Bitcoin ETF, CI Ethereum Fund/CI Galaxy Ethereum ETF and CI Solana Fund, the applicable Digital Asset is BTC, ETH and SOL, respectively.

Exchange-traded funds (ETFs) - exchange-traded funds or ETFs are investment funds whose securities are listed for trading on an exchange.

Money market instruments - short-term fixed income securities that mature in less than a year. They include government treasury bills, commercial paper and bankers' acceptances.

Staking Arrangements - means the staking of ETH or SOL held in the ETF's portfolio, to be conducted at the discretion of the Manager.

Sub-Adviser - refers to Galaxy Digital Capital Management LP as portfolio sub-adviser to the Funds.

Sub-Custodian or Sub-Custodians - refers to Gemini Trust Company, LLC, Coinbase, Inc., and/or Coinbase Custody Trust Company, LLC, acting as sub-custodians for CI Galaxy Bitcoin ETF and CI Galaxy Ethereum ETF in respect of their holdings of Digital Assets.

Underlying Funds - in respect of CI Bitcoin Fund, CI Ethereum Fund and CI Solana Fund, shall mean CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF and CI Galaxy Solana ETF, respectively; and in respect of CI Galaxy Core Multi-Crypto ETF and CI Galaxy Multi-Crypto Navigator ETF, shall mean CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF and CI Galaxy Solana ETF, as applicable.

What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund?

Building an investment portfolio is one of the most important financial decisions you can make. Choosing the right investments can help you achieve your financial goals, such as preparing for retirement or saving for a child's education.

However, investing successfully can be difficult to do on your own. You need accurate and timely information along with the right experience to build and maintain a portfolio of individual investments.

Mutual funds can make it easier.

A mutual fund brings together many different investors with similar goals. Each investor puts money into the mutual fund. A professional portfolio adviser uses that cash to buy a variety of investments for the mutual fund, depending on the mutual fund's objectives.

When the investments make money, everyone who invests in the mutual fund benefits. If the value of the investments falls, everyone shares in the loss. The size of your share depends on how much you invested. The more you put in, the more securities of the mutual fund you own and the greater your portion of the gains or losses. Mutual fund investors also share the mutual fund's expenses.

Most mutual funds invest in securities like stocks, bonds and money market instruments. The mutual funds may also invest in other mutual funds called "*underlying funds*", which may be managed by the Manager or its affiliates.

Advantages of Mutual Funds

Investing in a mutual fund has several advantages over investing in individual stocks, bonds and money market instruments on your own:

- **Professional money management.** Professional portfolio advisers have the skills and the time to do research and make decisions about which investments to buy, hold or sell.
- **Diversification.** Investment values are always changing. Owning several investments can improve long-term results because the ones that increase in value can compensate for those that do not. Mutual funds typically hold 30 or more different investments.
- **Accessibility.** You can sell your investment back to the mutual fund at any time. This is called a "*redemption*", and in some cases may result in a redemption fee or a short-term trading fee. With many other investments, your money is locked in or you have to find a specific buyer before you can sell.
- **Record keeping and reporting.** Mutual fund companies use sophisticated record keeping systems and send you regular financial statements, tax slips and reports.

Mutual Funds are not Guaranteed

Mutual funds generally own different types of investments, depending upon the mutual fund's investment objectives. The value of these investments will change from day to day, reflecting changes in interest rates, economic conditions and market and company news. As a result, the value of a mutual fund's securities may go up and down, and the value of your investment in a mutual fund may be more or less when you redeem it than when you purchased it.

While mutual funds have many advantages, it is important to remember that the full amount of your investment in any CI Alternative Fund is not guaranteed. Unlike bank accounts or guaranteed investment certificates, mutual fund investments are not covered by the Canada Deposit Insurance Corporation or any other government deposit insurer.

What are Units of an ETF?

Units of each ETF are issued and sold on a continuous basis. There is no maximum number of units that may be issued. The units of the ETFs are offered for sale at a price equal to the net asset value (“NAV”) of the securities determined at 4:00 p.m. (Toronto time) on the effective date of the subscription order.

Units of the ETFs are issued directly to a Designated Broker and ETF Dealers. “*Designated Broker*” and “*ETF Dealer*” are each defined in “*Responsibility for Mutual Fund Administration*” in Part A of the simplified prospectus.

Other than the units of CI Galaxy Core Multi-Crypto ETF (the “**New ETF**”) and the ETF C\$ Hedged Series of the Crypto ETFs and CI Galaxy Multi-Crypto Navigator ETF (the “**New Hedged ETF Series**”), the units of the ETFs are currently listed on the TSX, and investors can buy or sell such units on the TSX through registered brokers and dealers in the province or territory where the investors reside.

The units of the New ETF and the New Hedged ETF Series have been conditionally approved for listing on the TSX. Subject to satisfying the TSX’s original listing requirements, the units of the New ETF and the New Hedged ETF Series will be listed on the TSX, and investors will be able to buy or sell such units on the TSX, through registered brokers and dealers in the province or territory where investors reside.

Investors may incur customary brokerage commissions in buying or selling the units of the ETFs. No fees are paid by investors to the Manager or the ETFs in connection with buying or selling such units on the TSX.

Risk and Potential Return

As with most other investments, mutual funds come with a certain amount of risk. Mutual funds own different types of investments, depending on their investment objectives. The value of the investments in a mutual fund changes from day to day because of changes in interest rates, economic conditions and market or company news. As a result, the value of mutual fund securities will vary. When you sell your units of a Fund, you could get less money than you put in.

The amount of risk depends on the kind of fund you buy. Money market funds generally have low risk. They hold relatively safe short-term investments such as government treasury bills and other high-quality money market instruments. Income funds, which typically invest in bonds, have a higher amount of risk because their prices can change when interest rates change. Equity funds generally have the highest risk because they invest mostly in stocks whose prices can rise and fall daily.

Each Fund is considered an “*alternative mutual fund*”, meaning it is permitted to invest in asset classes and employ strategies generally prohibited for conventional mutual funds, such as the ability to invest more than 10% of its NAV in securities of a single issuer, the ability to borrow cash, to short sell beyond the limits prescribed for conventional mutual funds and to generally employ leverage. While these strategies will be used in accordance with the Fund’s investment objective and strategies, during certain market conditions, they may accelerate the pace at which your investment decreases in value.

Before you invest in a mutual fund, you need to decide what level of risk you are comfortable with. The answer depends in part on the kind of returns you expect. Generally, higher risk investments have a higher potential for gains and losses, while lower risk investments have a lower potential for gains and losses.

Another important factor is time. Think about how soon you will need the money. If you are saving to buy a house in the near future, you will probably want a lower risk investment to reduce the chance of the fund value dropping just when you need the cash. If you are investing for retirement in 20 years, your investment horizon is much longer. You may be able to afford to put more emphasis on equity funds because there is more time for equity funds to recover if prices should fall.

But potential return and your time horizon are not the only yardsticks for successful investing. Your choice of mutual fund also depends on how you feel about risk. An investor who checks fund prices every week and worries when investments temporarily lose value has low risk tolerance. If that describes you, you might be more comfortable with money market funds, bond funds, balanced funds and perhaps very conservative equity funds. An investor who is

willing to take on more risk might prefer a higher proportion of equity funds or more aggressive mutual funds that specialize in one industry or country.

Below are some of the most common risks that affect value. To find out which of these specific risks apply to a Fund you are considering, see the individual fund descriptions in this Part B of the simplified prospectus.

Types of Risks

Each Fund is subject to the following risks, other than *“Risk Factors Relating to ETH”* (which are applicable to CI Ethereum Fund, CI Galaxy Ethereum ETF and the Multi-Crypto ETFs), *“Risk Factors Relating to SOL”* (which are only applicable to CI Solana Fund and the Multi-Crypto ETFs) and *“Risk Factors Relating to Staking Arrangements”* (which are applicable only to CI Solana Fund and the Multi-Crypto ETFs).

In consideration for implementing and administering the Staking Arrangements for CI Galaxy Ethereum ETF, the Manager is seeking unitholder approval to receive a portion of the net staking rewards (the **“Staking Service Fee”**) at a special meeting of unitholders to be held on or about August 20, 2025.

The Manager intends to implement the Staking Service Fee on or about August 27, 2025. If unitholders approve the Staking Service Fee, the risk factors under *“Risk Factors Relating to Staking Arrangements”* will also apply to the Funds, as applicable, through their investments in CI Galaxy Ethereum ETF.

Each ETF is subject to the *“Risk Factors Relating to an Investment in an ETF”* and each Hedged Series of the Funds are subject to *“Risk Factors Relating to Hedged Series”*.

To the extent that the risk factors described below reference the Crypto ETFs only, such risk factors are also applicable to the Crypto Mutual Funds and the Multi-Crypto ETFs, due to their investments in the Crypto ETFs (and in respect of CI Solana Fund, its investments in CI Galaxy Solana ETF). For the purposes of this section, Crypto ETFs include CI Galaxy Solana ETF.

General Risks

Changes in Legislation Risk

There can be no assurance that tax, securities and other laws or the interpretation and application of such laws by courts or government authorities will not be changed in a manner which adversely affects a Fund’s unitholders.

Concentration Risk

Each of the Fund’s investment objective is to provide its unitholders with exposure to the applicable Digital Asset, and none of the Funds are expected to have exposure to any other investments or assets. Other than cash or cash equivalents, each Fund will invest substantially all of its assets in the applicable Digital Asset or Underlying Fund. As a result, the Funds’ holdings are not diversified. The NAV of each Fund may be more volatile than the value of a more broadly diversified portfolio or investment fund and may fluctuate substantially over short or long periods of time. This may have a negative impact on the NAV of the Funds.

An investment in the Funds may be deemed speculative and is not intended as a complete investment program. An investment in the Funds should be considered only by persons financially able to maintain their investment and who can bear the risk of loss associated with an investment in the Underlying Funds and/or their respective Digital Asset. Investors should review closely the objective and strategy of the Funds and their Underlying Funds, as applicable, and familiarize themselves with the risks associated with an investment in the Funds as well as the Underlying Funds, as applicable.

Cyber Security Risk

With the increased use of technologies, such as the internet, to conduct business, the Funds are susceptible to operational, information security, and related risks through breaches in cyber security. In general, cyber incidents can result from deliberate attacks or unintentional events. Cyber-attacks include, but are not limited to, gaining unauthorized access to digital systems (e.g., through *“hacking”* or malicious software coding) for purposes of misappropriating assets or sensitive information, corrupting data, or causing operational disruption. Cyber-attacks

may also be carried out in a manner that does not require gaining unauthorized access, such as causing denial-of-service attacks on websites (i.e., efforts to make network services unavailable to intended users). Cyber incidents affecting the Funds, the Manager or the Funds' service providers (including, but not limited to, the Funds' Custodians) have the ability to cause disruptions and impact each of their respective business operations, potentially resulting in financial losses, interference with the calculation of the NAV of the Funds or a series of a Fund, impediments to trading the portfolio securities of the Fund, the inability to process transactions in units of the Funds, including purchases and redemptions of units of the Funds, violations of applicable privacy and other laws, regulatory fines, penalties, reputational damage, reimbursement or other compensation costs, or additional compliance costs associated with the implementation of any corrective measures. Similar adverse consequences could result from cyber incidents affecting the Digital Assets, the Crypto ETFs and counterparties with which the Crypto ETFs engage in transactions.

The Manager has established risk management systems designed to reduce the risks to the Funds associated with cyber security. However, there is no guarantee that such efforts will succeed. Furthermore, the Manager and the Funds cannot control the cyber security plans and systems of the Funds' service providers, the counterparties with which the Crypto ETFs engage in transactions, or any other third parties whose operations may affect the Funds or their unitholders.

Global Economic Conditions and Market Risk

Market risk is the risk that a Fund's investments will go down in value, including the possibility that such investments will go down sharply or unpredictably. Such decline may be based on company-specific developments, industry-specific developments and/or market trends. Several factors can influence market trends, such as general economic conditions, regulatory changes, changes in interest rates and currency exchange rates, geopolitical changes, global pandemics or health crises, wars and occupations, terrorism and catastrophic events. These events could also have an acute effect on individual issuers or related groups of issuers, including as a result of a disruption to business operations due to quarantined employees, customers and suppliers in affected areas and due to closure of offices, manufacturing facilities, warehouses and logistics supply chain.

The securities markets have in recent years been characterized by significant volatility and unpredictability due to similar events described above. Continued instability in the markets may increase the risks inherent in portfolio investments made by a Fund and a substantial drop in the markets in which a Fund invests could be expected to have a negative effect on the Fund.

Large Redemption Risk

A Fund may have particular investors who own a large proportion of its NAV of the Fund. For example, other institutions such as banks and insurance companies or other mutual fund companies may purchase units of the Fund for their own mutual funds, segregated funds, structured notes or discretionary managed accounts. Retail investors may also have significant holdings of units of the Fund.

Large redemptions may result in (a) large sales of portfolio assets, impacting market value; (b) increased transaction costs (e.g., commission); (c) capital gains being realized, which may increase taxable distributions to investors; and/or (d) the termination of the Fund. If this should occur, the returns of investors (including other mutual funds that invest in such underlying funds) may also be adversely affected. A Fund may agree with the large investor to allow for in-kind redemptions, by transferring portfolio assets of an equal value to the large redeeming investor, if assets of the Fund cannot be sold at advantageous prices without a significant impact to the Fund.

Conversely, if one or more of these investors decides to increase its investment in the Funds, the Funds may have to hold a relatively large position in cash for a period of time while the portfolio manager attempts to find suitable investments. This could negatively impact a Fund's return.

Liquidity Risk

Liquidity is a measure of how easy it is to convert an investment into cash. An investment may be less liquid if it is not widely traded or if there are restrictions on the exchange where the trading takes place. Some securities may be difficult to buy or sell because they are not well known or because political or economic events significantly affect them. These include investments in specific sectors, especially commodity sectors, and investments in developing

or smaller markets. In addition, smaller companies may be hard to value because they are developing new products or services for which there is not yet a developed market or revenue stream. They may only have a small number of shares in the market, which may make it difficult for a Fund to buy or sell shares when it wants to. Investments with low liquidity can have dramatic changes in value.

No Assurance of Achieving Objective

There is no assurance that an ETF will achieve its investment objective. It is appropriate only for investors who have the capacity to absorb a loss on their investment.

No Direct Ownership Interest in the Digital Assets

An investment in the Funds does not constitute a direct investment by unitholders in the Digital Assets included in the Funds' or Underlying Funds' portfolio, as applicable.

No Guarantee of a Return on Investment

There is no guarantee that an investment in the Funds will earn any positive return in the short or long term. The NAV of a Fund will generally fluctuate with the price of the applicable Digital Asset or, if applicable, the value of any Underlying Fund in which it invests. No interest or dividends are earned on the Digital Asset held by a Crypto ETF.

Operational Risk

A Fund's day-to-day operations may be adversely affected by circumstances beyond the reasonable control of the Manager, such as failure of technology or infrastructure, natural disasters or global pandemics that affect the productivity of the Manager's or its service providers' workforce.

Possible Loss of Investment

An investment in the Funds is appropriate only for investors who have the capacity to absorb a loss on their investment.

Risks Related to Passive Investments

An investment in the Funds should be made with an understanding that the NAV of the applicable Fund or Underlying Fund will generally fluctuate in accordance with the price of the applicable Digital Asset, based on the applicable Index. Because each Crypto ETF's objective is to invest in the applicable Digital Asset on a passive basis, its holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of the applicable Digital Asset declines or is expected to decline.

Series Risk

Each Fund issues different series of units. Each series has its own fees and expenses, which the Fund tracks separately. However, if one series is unable to meet its financial obligations, the other series are legally responsible for making up the difference.

Tariff Risk

Beginning in January 2025, the U.S. announced certain tariffs on imports from various countries, including Canada. In response, the Government of Canada announced retaliatory tariffs on certain imports from the U.S. and the Government of Ontario announced a levy on electricity sold into the U.S.

There is uncertainty as to whether additional tariffs or retaliatory tariffs will be implemented, which countries will be subject to tariffs, the quantum of such tariffs, the goods on which they may be applied and the ultimate impact on supply chains and business costs. Such uncertainty may also adversely impact the performance of the global economy and individual companies, even if such companies are not directly subject to tariffs. Changes in U.S. trade policies, levies imposed by Canadian governments, the enforcement of new and existing trade laws, and the responses of other countries could, in certain circumstances, impose significant burdens on international trade, the broader financial system and the economy. Increased global trade restrictions may also result in inflation. Further, the potential introduction of protectionist or retaliatory international trade tariffs, domestic "buy local" policies, sanctions or other barriers to international commerce may impact the global economy and stability of global

financial markets which could consequently have a material adverse impact on the markets and securities in which a Fund may invest.

Tax Risk

In order to qualify as a mutual fund trust under the Income Tax Act (Canada) (the “**Income Tax Act**”), each of the Funds must comply with various requirements contained in the Income Tax Act, including to restrict its undertaking to the investment of its Funds in property. The Funds are expected to qualify, or be deemed to qualify, as mutual fund trusts for the purposes of the Income Tax Act at all material times. If a Fund does not qualify or ceases to qualify as a mutual fund trust (whether as a result of a change in law or administrative practice, or due to its failure to comply with the current Canadian requirements for qualification as a mutual fund trust), it may experience various potential adverse consequences. For example, the Fund would be subject to a requirement to withhold tax on distributions made to non-resident unitholders of any taxable capital gains; its units would not qualify as “*Canadian securities*” for the purposes of the election provided in subsection 39(4) of the Income Tax Act and it would not be entitled to the Capital Gains Refund. A Fund that does not qualify as a mutual fund trust will be a “*financial institution*” for purposes of the “*mark-to-market property*” rules contained in the Income Tax Act if one or more financial institutions, as defined in the Income Tax Act, owns more than 50% of the fair market value of the units of such Fund. A Fund that becomes or ceases to be a financial institution will be deemed to have a year-end for tax purposes at such time, which would result in an unscheduled distribution of the Fund’s net income and net realized capital gains, if any, at such time to unitholders so that the Fund is not liable for ordinary income tax on such amounts under Part I of the Income Tax Act. A Fund that does not qualify as a mutual fund trust may also be liable to pay alternative minimum tax (“**AMT**”). Recent amendments to the Income Tax Act have broadened the base of the AMT. These amendments, inter alia, (i) increase the AMT rate from 15% to 20.5%; (ii) increase the AMT capital gains inclusion rate from 80% to 100%; (iii) disallow 50% of a number of deductions, including interest on funds borrowed to earn income from property and non-capital loss carryforwards; and (iv) disallow 50% of most non-refundable credits. The Income Tax Act also was amended to introduce new exclusions from the AMT regime, including an exception for a unit trust all or substantially all the fair market value of which is represented by units listed on a designated stock exchange or a trust that meets the definition of an “*investment fund*” for purposes of the “*loss restriction event*” rules in the Income Tax Act (as described in further detail below). No assurances can be given that a Fund will meet or will continue to meet the “*investment fund*” definition.

The SIFT rules (“**SIFT Rules**”) apply to trusts that are resident in Canada for the purposes of the Income Tax Act and that hold one or more “*non-portfolio properties*” (as defined in the Income Tax Act) and the units of which are listed or traded on a stock exchange or other public market (“**SIFT trust**”). For this purpose, “*non-portfolio property*” of a Fund would include (i) property that the Fund (or a person or partnership that does not deal at arm’s length with the Fund for purposes of the Income Tax Act) uses in the course of carrying on a business in Canada and (ii) certain investments in underlying funds that themselves hold “*non-portfolio property*”. Under the SIFT Rules, if a Fund were a SIFT trust it will generally be subject to tax, at a combined federal and provincial tax rate comparable to that applicable to a Canadian corporation on income from a business carried on by it in Canada or from a non-portfolio property (other than a taxable dividend) and net taxable capital gains realized on the disposition of a non-portfolio property (generally, “*non-portfolio earnings*” under the Income Tax Act), to the extent this income or gain is distributed to unitholders. Unitholders who receive distributions from a Fund of this income and gain are deemed to receive an eligible dividend from a Canadian corporation for tax purposes. The total of the tax payable by a Fund on its non-portfolio earnings and the tax payable by a unitholder on the distribution of those earnings will generally be more than the tax that would have been payable in the absence of the tax rules that apply to a SIFT trust.

The Funds generally will treat gains (or losses) as a result of any disposition of Digital Assets or units of an Underlying Fund, as the case may be, as capital gains (or capital losses). The Canada Revenue Agency (“**CRA**”) has stated that with respect to gains (or losses) of a taxpayer resulting from cryptocurrency (which includes the Digital Assets and by extension may include an Underlying Fund that invests in Digital Assets), for tax purposes, it generally treats cryptocurrency (which includes the Digital Assets and by extension may include an Underlying Fund that invests in Digital Assets) as capital gains (or capital losses), unless the gains (or losses) result from carrying on a business or an adventure or concern in the nature of trade. However, the CRA has also stated that it generally treats cryptocurrency like a commodity for purposes of the Income Tax Act and that gains (or losses) of mutual fund trusts resulting from transactions in commodities should generally be treated for income tax purposes as ordinary income rather than as

capital gains, although the treatment in each particular case remains a question of fact to be determined having regard to all the circumstances. As each Fund intends to be a long-term holder of cryptocurrency or Underlying Funds that invest in cryptocurrency, the Manager anticipates that each Fund will generally treat gains (or losses) as a result of any disposition of cryptocurrency or units of an Underlying Fund as capital gains (or capital losses). In addition, each of the Crypto Mutual Funds and the Multi-Crypto ETFs has made or will make an election in accordance with subsection 39(4) of the Income Tax Act to have each of its “*Canadian securities*” treated as capital property.

In addition, the Digital Assets may become subject to network forks and/or certain related occurrences such as air drops (see “*Risk Factors Relating to the Digital Assets – Network Forks*” and “*Risk Factors Relating to the Digital Assets – Air Drops*” for more information). The tax treatment of forks, air drops and other occurrences affecting the Digital Assets is subject to considerable uncertainty, and the CRA may disagree with positions taken by a Fund in this regard.

If any transactions of a Fund are reported by it on capital account, but are subsequently determined by the CRA to be on income account, or if the Fund were to disagree with positions taken by a Fund in relation to forks, air drops or other occurrences affecting the Digital Assets, there may be an increase in the net income of the Fund, with the result that the Fund could be reassessed by the CRA to increase its taxable income by the amount of such increase. The CRA could also assess a Fund for a failure of the Fund to withhold tax on distributions made by it to non-resident unitholders that are subject to withholding tax. Any such re-determination by the CRA may result in the Fund being liable for unremitted withholding taxes on prior distributions made to unitholders who were not resident in Canada for the purposes of the Income Tax Act at the time of the distribution. As the Fund may not be able to recover such withholding taxes from the non-resident unitholders whose units are redeemed, payment of any such amounts by the Fund would reduce the NAV of the Fund.

Under the Income Tax Act, the excessive interest and financing expenses limitation rules (the “**EIFEL Rules**”), if applicable to an entity, may limit the deductibility of interest and other financing-related expenses by the entity to the extent that such expenses, net of interest and other financing-related income, exceed a fixed ratio of the entity’s adjusted EBITDA. The EIFEL Rules and their application are highly complex, and there can be no assurances that the EIFEL Rules will not have adverse consequences to a Fund. If the EIFEL Rules were to apply to restrict deductions otherwise available to the Fund, the taxable component of distributions paid by the Fund to unitholders may be increased, which could reduce the after-tax return associated with an investment in units of the Fund. Although certain investment funds that are considered to be “*excluded entities*” for purposes of the EIFEL Rules may be excluded from the application of the EIFEL Rules, there can be no assurance that the Funds would qualify as an “*excluded entity*” for these purposes, and hence the Funds could be subject to the EIFEL Rules.

As part of the 2024 Federal Budget, the Department of Finance (Canada) (“**Finance**”) announced that it would be engaging in a consultation to help modernize and simplify the qualified investment rules of the registered plans regime. As part of that consultation Finance officials welcomed feedback on certain specific questions, including whether crypto-backed assets are appropriate as qualified investments for registered plans. Submissions for this consultation were open until July 15, 2024. It is the Manager’s understanding that several industry associations provided submissions on the continued appropriateness of crypto-backed assets like the Funds for registered plans. The Manager will monitor developments with the consultation process and what the results may mean, if anything, for investors in the Funds. Where a registered plan acquires or holds a security that is not a qualified investment under the Income Tax Act for the registered plan, adverse tax consequences may arise for the registered plan and the annuitant, beneficiary, subscriber or holder thereof.

If a Fund experiences a “*loss restriction event*”, the Fund will: (i) be deemed to have a year-end for tax purposes (which would result in an allocation of the Fund’s taxable income at such time to unitholders so that the Fund is not liable for income tax on such amounts), and (ii) become subject to the loss restriction rules generally applicable to corporations that experience an acquisition of control, including a deemed realization of any unrealized capital losses and restrictions on their ability to carry forward losses. Generally, a Fund will be subject to a loss restriction event when a person becomes a “*majority-interest beneficiary*” of the Fund, or a group of persons becomes a “*majority-interest group of beneficiaries*” of the Fund, as those terms are defined in the affiliated persons rules contained in the Income Tax Act, with appropriate modifications. Generally, a majority-interest beneficiary of a Fund will be a beneficiary who, together with the beneficial interests of persons and partnerships with whom the beneficiary is

affiliated, has a fair market value that is greater than 50% of the fair market value of all the interests in the income or capital, respectively, in the Fund. There can be no assurance that a Fund will not become subject to the loss restriction rules and there can be no assurance when distributions resulting from a loss restriction event will be made. Trusts that qualify as “*investment funds*” as defined in the rules in the Income Tax Act relating to loss restriction events are generally excepted from the application of such rules. An “*investment fund*” for this purpose includes a trust that meets certain conditions, including satisfying certain of the conditions necessary to qualify as a “*mutual fund trust*” for purposes of the Income Tax Act, not using any property in the course of carrying on a business and complying with certain asset diversification requirements. As described above, no assurance can be given that a Fund will meet or will continue to meet the “*investment fund*” definition.

Underlying Fund Risk

A Fund may pursue its investment objectives indirectly by investing in securities of other funds, including ETFs, in order to gain access to the strategies pursued by those underlying funds. In doing so, the risks associated with investing in that Fund include the risks associated with the securities in which the Underlying Fund invests, along with the other risks of the Underlying Fund. There can be no assurance that any use of such multi-layered fund-of-fund structures will result in any gains for a Fund. If an Underlying Fund that is not traded on an exchange suspends redemptions, a Fund will be unable to value part of its portfolio and may be unable to redeem securities. In addition, the portfolio adviser could allocate a Fund’s assets in a manner that results in that Fund underperforming relative to its peers.

Underlying Funds in which a Fund may invest can be expected to incur fees and expenses for their operations which would be in addition to those incurred by a Fund directly.

U.S. Currency Exposure

The Funds use U.S. dollars as both their functional and presentation currency, and their investments are also denominated in U.S. dollars.

Withholding Tax Risk

A Fund may invest in global securities and as a result may be subject to foreign withholding tax on such securities of foreign issuers. While the Funds intend to make investments in such a manner as to minimize the amount of foreign taxes incurred under foreign tax laws and subject to any applicable tax conventions with respect to taxes on income and on capital, investments in global securities may subject a Fund to foreign taxes on distributions paid or credited to it or any gains realized on the disposition of such securities. The return on a Fund’s portfolio will be net of such foreign withholding tax, unless the terms of the securities in such portfolio require the issuers of such securities to “*gross-up*” payments so that a holder of such securities receives the amount that it would have received in the absence of such withholding tax. There can be no assurances that (i) distributions and gains on securities held in a Fund or Underlying Fund’s portfolio will not be subject to foreign withholding tax, or (ii) the terms of securities held in a Fund or Underlying Fund’s portfolio will provide for the gross-up referred to above. There is no guarantee that the rate of withholding tax will not increase which may significantly affect returns.

Canada has entered into tax treaties with certain foreign countries which may entitle a Fund to a reduced rate of tax on such income. Some countries require the filing of a tax reclaim or other forms to receive the benefit of the reduced tax rate. Whether or when a Fund will receive the tax reclaim is within the control of the particular foreign country. Information required on these forms may not be available (such as securityholder information); therefore, a Fund may not receive the reduced treaty rates or potential reclaims. Certain countries have conflicting and changing instructions and restrictive timing requirements which may cause a Fund or Underlying Fund not to receive the reduced treaty rates or potential reclaims. Certain countries may subject capital gains realized by the Fund on sale or disposition of certain securities to taxation in that country. If a Fund obtains a refund of foreign taxes, the NAV of the Fund will not be restated and the amount will remain in the Fund to the benefit of the then-existing unitholders.

Risk Factors Relating to the Digital Assets

Air Drops

The Digital Assets may become subject to an occurrence similar to a fork, which is known as an “*air drop*”. In an air drop, the promoters of a new digital asset announce to holders of another digital asset that they will be entitled to claim a certain amount of the new digital asset for free. For the same reasons as described above with respect to hard forks, the Crypto ETFs may or may not choose, or be able, to participate in an air drop, or may or may not be able to realize the economic benefits of holding the new digital asset. The timing of any such occurrence is uncertain, and the Manager of the Crypto ETFs has sole discretion whether to claim a new asset created through an airdrop.

Access Loss or Theft

There is a risk that some or all of a Crypto ETF’s holdings of a Digital Asset could be lost, stolen, destroyed or inaccessible, potentially by the loss or theft of the private keys of the Digital Asset held by the Sub-Custodian(s) associated with the public addresses that hold the Digital Assets of the Crypto ETFs and/or destruction of storage hardware. Multiple thefts of the Digital Assets and other digital assets from other holders have occurred in the past. Because of the decentralized process for transferring the Digital Assets, thefts can be difficult to trace, which may make the Digital Assets particularly attractive targets for theft. The Crypto ETFs have adopted security procedures intended to protect their assets, but there can be no assurance that those procedures will be successful in preventing such loss, theft or restriction on access. You should not invest unless you understand the risk that the Crypto ETFs may lose possession or control of their assets. Access to the Digital Assets held by the Crypto ETFs could be restricted by natural events (such as an earthquake or flood) or human actions (such as a terrorist attack). The Digital Assets held in custody accounts of the Crypto ETFs will likely be an appealing target for hackers or malware distributors seeking to destroy, damage or steal the Digital Assets or private keys of the Crypto ETFs.

Security breaches, cyber-attacks, computer malware and computer hacking attacks have been a prevalent concern for the digital asset trading platforms on which the Digital Assets trade. Any cyber security breach caused by hacking, which involves efforts to gain unauthorized access to information or systems, or to cause intentional malfunctions or loss or corruption of data, software, hardware or other computer equipment, and the inadvertent transmission of computer viruses, could harm the Crypto ETFs’ business operations or reputation, resulting in loss of the Crypto ETFs’ assets. Digital asset trading platforms may in particular be at risk of cyber security breaches orchestrated or funded by state actors. For example, it has been reported that South Korean digital asset trading platforms have been subject to cybersecurity attacks by North Korean state actors with the intent of stealing digital assets possibly with the intention of evading international economic sanctions. Any problems relating to the performance and effectiveness of security procedures used by the Crypto ETFs and their Sub-Custodian(s) to protect the Digital Assets, such as algorithms, codes, passwords, multiple signature systems, encryption and telephone call-backs, will have an adverse impact on the Crypto ETFs and their units. Furthermore, if and as the Crypto ETFs’ holdings of the Digital Assets grow, the Crypto ETFs and their Sub-Custodian(s) may become a more appealing target for cyber security threats such as hackers and malware. Furthermore, cybersecurity attacks orchestrated or funded by state actors may be particularly difficult to defend against because of the resources that state actors have at their disposal.

No storage system is impenetrable, and storage systems employed by the Crypto ETFs and their Sub-Custodian(s) may not be free from defect or immune to force majeure events. Any loss due to a security breach, software defect or force majeure event generally will be borne by the Crypto ETFs, which will adversely affect the value of their units.

Such storage systems and operational infrastructure may be breached due to the actions of outside parties, error or insider malfeasance of an employee of the Crypto ETFs’ Manager, Sub-Adviser or Custodians, or otherwise, and, as a result, an unauthorized party may obtain access to the Crypto ETFs’, or the Crypto ETFs’ Manager’s, Sub-Adviser’s, or Sub-Custodian(s)’ storage systems, private keys, data or applicable Digital Asset. Additionally, outside parties may attempt to fraudulently induce employees of the Crypto ETFs’ Manager, Custodian, Sub-Custodian(s), or the Sub-Adviser to disclose sensitive information in order to gain access to the Crypto ETFs’ infrastructure. The Crypto ETFs’ Manager, Sub-Adviser, Custodian, Sub-Custodian(s) or any technological consultant engaged by them may periodically examine and propose modifications to storage systems, protocols and internal controls to address the use of new devices and technologies to safeguard the Crypto ETFs’ systems and the Digital Assets. As the techniques used to obtain unauthorized access, disable or degrade service, or sabotage systems change frequently, or may be

designed to remain dormant until a predetermined event and often are not recognized until launched against a target, the Crypto ETFs' Manager or Sub-Adviser may be unable to anticipate these techniques or implement adequate preventative measures. If an actual or perceived breach of a storage system occurs, a loss of confidence in the Bitcoin Network, Ethereum Network and Solana Network (collectively, the **"Networks"** and each, a **"Network"**), as applicable, may decrease the market price of the Crypto ETFs' investments. An actual or perceived breach may also cause unitholders of the Crypto ETFs to seek redemption of or sell their units, which may harm the Crypto ETFs' investment performance.

If a Crypto ETFs' holdings of a Digital Asset are lost, stolen or destroyed under circumstances rendering a party liable to an Underlying Fund, the responsible party may not have the financial resources sufficient to satisfy such Underlying Fund's claim. For example, as to a particular event of loss, the only source of recovery for the Crypto ETFs may be limited to the relevant Custodian or, to the extent identifiable, other responsible third parties (for example, a thief or terrorist), any of which may not have the financial resources (including liability insurance coverage) to satisfy a valid claim of the Crypto ETFs. Similarly, as noted below, a Crypto ETF's Custodian and Sub-Custodian(s) have limited liability to the Crypto ETF, which will adversely affect a Crypto ETF's ability to seek recovery from them, even when they are at fault.

Banking Services

A number of companies that provide cryptocurrency-related services have been unable to find banks that are willing to provide them with bank accounts and banking services. Similarly, a number of such companies have had their existing bank accounts closed by their banks. Banks may refuse to provide bank accounts and other banking services to Digital Asset-related companies or companies that accept the Digital Assets for a number of reasons, such as perceived compliance risks or costs. The difficulty that many businesses that provide Digital Asset-related services have and may continue to have in finding banks willing to provide them with bank accounts and other banking services may be currently decreasing the usefulness of the Digital Assets as a payment system and harming public perception of the Digital Assets or could decrease their usefulness and harm their public perception in the future. Similarly, the usefulness of the Digital Assets as payment systems and the public perception of the Digital Assets could be damaged if banks were to close the accounts of many or of a few key businesses providing Digital Asset-related services. This could decrease the value of the Digital Asset held by a Crypto ETF and therefore adversely affect an investment in the applicable Fund.

Bans or Prohibitions Affecting the Digital Assets

Digital assets including the Digital Assets currently face an uncertain regulatory landscape in many jurisdictions. Various foreign jurisdictions may, in the near future, adopt laws, regulations or directives that affect the Digital Assets and other digital assets. Such laws, regulations or directives may conflict with those of Canada or the United States and may negatively impact the acceptance of the Digital Assets by users, merchants and service providers in such jurisdictions and may therefore impede the growth or sustainability of the digital asset economy or otherwise negatively affect the value of the Digital Assets and therefore the value of the units of the Funds.

Additionally, regulators and legislatures have taken action against digital asset businesses or enacted restrictive regimes in response to adverse publicity arising from hacks, consumer harm, or criminal activity stemming from digital asset activity. Furthermore, it has been reported that certain South Korean digital asset trading platforms have experienced cybersecurity attacks by North Korean state actors with the intent of stealing digital assets. Cybersecurity attacks by state actors, particularly for the purpose of evading international economic sanctions, are likely to attract additional regulatory scrutiny to the acquisition, ownership, sale and use of digital assets, including the Digital Assets. Such adverse publicity or regulatory scrutiny could adversely affect the value of the Digital Assets, and therefore the value of the units of the Funds.

Control of Outstanding Digital Assets

A portion of the total supply of BTC may be concentrated among a relatively small number of holders. These holdings may be associated with early adopters, trading platforms, custodians, or institutional investors. Due to the pseudonymous nature of blockchain transactions, a single entity may control multiple wallets, resulting in a greater effective concentration than may be apparent from publicly available data. As with other digital assets, the large-

scale sale of BTC by one or more significant holders could adversely affect market prices and contribute to volatility, which may negatively impact an investment in the Funds.

The founders of the Ethereum Network may control large amounts of ETH. There are several digital asset trading platforms that have large holdings of ETH, which can be found at: <https://etherscan.io/accounts>. Where there appear to be a few concentrated holders of ETH based on individual addresses, some holders may have their ETH spread across multiple addresses.

While publicly available information concerning the identity of SOL holders and the amount of SOL they hold is limited, the information that is publicly available suggests that a substantial minority (and possibly a majority) of SOL currently outstanding are held by Solana Labs, Inc., the Solana Foundation, the founders of SOL, its early employees and service providers and early investors in the technology. It is not uncommon for a relatively small number of digital wallets to hold a substantial amount of the outstanding supply of any given cryptocurrency, and it is possible that some of these wallets would be controlled by the same person or entity. Moreover, it is possible that other persons or entities control multiple wallets that collectively hold a significant amount of any given cryptocurrency, even if each wallet individually only holds a small amount.

If one of these top holders or group of holders of the Digital Assets were to liquidate their position, it could cause volatility in the price of the applicable Digital Asset and in turn adversely affect an investment in the Funds.

Central Bank Competition

Central banks have introduced digital forms of legal tender called Central Bank Digital Currencies (“CBDCs”). China’s CBDC project, known as Digital Currency Electronic Payment, has reportedly been tested in a live pilot program conducted in multiple cities in China. A study published by the Bank for International Settlements estimates that 94% of the 86 central banks that responded to a survey on CBDCs are exploring CBDCs in some capacity. The survey also indicates that up to 15 CBDCs will likely be issued by 2030. According to the International Monetary Fund, there are three CBDCs officially in circulation - the Sand Dollar in The Bahamas, the eNaira in Nigeria, and JAM-DEX in Jamaica – and several others that are in various pilot stages, including the e-CNY in China. CBDCs, as legal tender in the issuing jurisdiction, could have an advantage when competing with, or replace, other cryptocurrencies as a medium of exchange or store of value. As a result, the value of Digital Assets could decrease, which could adversely affect an investment in the Funds.

Competitors to the Digital Assets

A competitor to the Digital Assets which gains popularity and greater market share may precipitate a reduction in demand, use and prices of the Digital Assets, which may adversely impact the NAV of the Funds and an investment in their units. Similarly, the Digital Assets and the price of the Digital Assets could be reduced by competition from incumbents in the credit card and payments industries, which may adversely impact an investment in the Funds.

Control of Processing Power

The Networks are secured by a proof-of-work algorithm, whereby the collective strength of the applicable Network participants’ processing power protects the Network. If a malicious actor or botnet (i.e., a volunteer or hacked collection of computers controlled by networked software coordinating the actions of the computers) obtains a majority of the processing power dedicated to mining on a Network, it may be able to construct fraudulent blocks or prevent certain transactions from completing, either in a timely manner or at all. The malicious actor or botnet could control, exclude or modify the ordering of transactions. While a malicious actor would not be able to generate new Digital Asset interests or transactions using such control, it could “double-spend” its own Digital Asset interests (i.e., spend the same Digital Asset interests in more than one transaction) and prevent the confirmation of other users’ transactions for so long as it maintained control. To the extent that such malicious actor or botnet did not yield its control of the processing power on the applicable Network or the Network community did not reject the fraudulent blocks as malicious, reversing any changes made to the blockchain may not be possible. Further, a malicious actor or botnet could create a flood of transactions in order to slow down confirmations of transactions on the Network.

Some digital asset networks have been subject to malicious activity achieved through control of over 50% of the processing power on the network. The possible crossing of the 50% threshold indicates a greater risk that a single

mining pool could exert authority over the validation of digital asset transactions, and this risk is heightened if over 50% of the processing power on a Network falls within the jurisdiction of a single governmental authority. For example, it is believed that more than 50% of the processing power on the Bitcoin Network at one time was located in China. Because the Chinese government has subjected digital assets to heightened levels of scrutiny recently, forcing several digital asset trading platforms to shut down and has begun to crack down on mining activities, there is a risk that the Chinese government could also achieve control over more than 50% of the processing power on a Network. To the extent that the Digital Assets' ecosystems, including the core developers and the administrators of mining pools, do not act to ensure greater decentralization of mining processing power, the feasibility of a malicious actor obtaining control of the processing power on a Network will increase, which may adversely affect an investment in the Funds.

Control of Developers

A malicious actor may also obtain control over a Network through its influence over core or influential developers. For example, this could allow the malicious actor to block legitimate Network development efforts or attempt to introduce malicious code to a Network under the guise of a software improvement proposal by such a developer. Any actual or perceived harm to a Network as a result of such an attack could result in a loss of confidence in the source code or cryptography underlying the Network, which could negatively impact the demand for the applicable Digital Asset and therefore adversely affect the prices of such Digital Asset and an investment in the applicable Funds.

Control of Validator Network (applicable to all the Funds except CI Galaxy Bitcoin ETF and CI Bitcoin Fund)

Transactions on the Solana and Ethereum Networks are validated by a proof-of-stake ("PoS") consensus mechanism, whereby transactions are validated by validators that have "staked", or deposited, SOL or ETH, as applicable, through a smart contract in order to be accepted as validators. Unlike proof-of-work ("PoW") consensus mechanisms, whereby control of a blockchain network is dictated by controlling a majority of the aggregate computing power devoted to mining additional blocks in the public chain, blockchain networks that rely on PoS consensus mechanisms are ultimately controlled by a pool of validators that have staked their cryptocurrency on the blockchain network for which they are responsible for validating transactions on the network. If a malicious actor or botnet (i.e., a volunteer or hacked collection of computers controlled by networked software coordinating the actions of the computers) obtains control over a supermajority (66 2/3%) of the staked SOL or ETH validator pool, it may be able to construct fraudulent blocks or prevent certain transactions from completing, either in a timely manner or at all. The malicious actor or botnet could control, exclude or modify the ordering of transactions. While a malicious actor would not be able to generate new SOL or ETH interests or transactions using such control, it could "double-spend" its own tokens (i.e., spend the same interests in more than one transaction) and prevent the confirmation of other users' transactions for so long as it maintained control. To the extent that such malicious actor or botnet did not yield its control of the validator pool on the Solana Network or the Ethereum Network, or the network community did not reject the fraudulent blocks as malicious, reversing any changes made to the blockchain may not be possible. Further, a malicious actor or botnet could create a flood of transactions in order to slow down confirmations of transactions on the Solana Network or the Ethereum Network.

While blockchain networks that rely on PoS consensus mechanism are theoretically safer from a "majority attack" described above than blockchain networks that rely on PoW consensus mechanisms—since an attacker would need to gain control of the actual staked cryptocurrency assets instead of the computing power devoted to mining additional cryptocurrency assets—the risk of a majority attack remains. Less diversified PoS blockchain networks, like the Solana Network, may be more susceptible to such attacks than more diversified PoS blockchain networks like the Ethereum Network, since the Solana Network currently has a small number of validation nodes than certain other networks and a more limited amount of staked cryptocurrency that would need to be controlled in order to successfully stage a majority attack. To the extent that the Solana ecosystem, including the core developers and validators, does not act to ensure greater decentralization of validation nodes, the feasibility of a malicious actor obtaining control of the processing power on the Solana Network could increase, which may adversely affect an investment in the applicable Funds. Similarly, while the Ethereum Network is more decentralized, a successful attack by a malicious actor gaining control over a majority of staked ETH could nonetheless pose systemic risks to the Ethereum ecosystem.

Demand for the Digital Assets May Exceed Supply

The demand for the Digital Assets may develop at a pace which exceeds supply which may frustrate users and cause them to lose faith in the Networks, which may in turn adversely affect the prices of the Digital Assets and an investment in the Funds.

Digital Asset Investment Risks

The further development and acceptance of the Digital Assets is subject to a variety of factors that are difficult to evaluate. The slowing or stopping of the development or acceptance of the Digital Assets may adversely affect the prices of the Digital Assets and an investment in the Funds.

The use of the Digital Assets to, among other things, buy and sell goods and services is part of the new, experimental and rapidly evolving cryptocurrency industry. While the Digital Assets are a prominent part of this industry, they are not the only part. The growth of this industry, as well as the Digital Assets' market shares, are subject to a high degree of uncertainty. The factors affecting the Digital Assets' further growth and development include, but are not limited to:

- continued worldwide growth in the adoption and use of the Digital Assets;
- government and quasi-government regulation of the Digital Assets and their use, or restrictions on or regulation of access to and operation of the Networks;
- changes in consumer demographics, demand and preferences;
- the maintenance and development of the applicable open-source software protocol of the Networks;
- the availability and popularity of other forms or methods of buying and selling goods and services, including other cryptocurrencies and new means of using fiat currencies;
- the further development of additional applications and scaling solutions; and
- general economic conditions and the regulatory environment relating to the Digital Assets and other cryptocurrencies; and negative consumer or public perception of the Digital Assets or cryptocurrencies generally.

The Digital Assets are loosely regulated and there is no central marketplace for the Digital Assets. Supply is determined by a computer code, not by a central bank, and prices can be extremely volatile. Additionally, digital asset trading platforms may suffer from operational issues, such as delayed execution, that could have an adverse effect on the Funds. Some digital asset trading platforms have been closed due to fraud, failure or security breaches.

Several factors may affect the prices of the Digital Assets, including, but not limited to supply and demand, investors' expectations with respect to the rate of inflation, interest rates, currency exchange rates or future regulatory measures (if any) that restrict the trading of one or both of the Digital Assets or the use of the Digital Assets as a form of payment. There is no assurance that the Digital Assets will maintain their long-term value in terms of purchasing power in the future, or that mainstream retail merchants will accept the Digital Assets as a form of payment.

The Digital Assets are created, issued, transmitted, and stored according to protocols run by computers in the applicable Networks. It is possible a Digital Asset's protocol has undiscovered flaws which could result in the loss of some or all of the assets held by a Crypto ETF. There may also be network-scale attacks against a Digital Asset's protocol, which could result in the loss of some or all of the Digital Asset held by a Crypto ETF. Advancements in quantum computing could break a Digital Asset's cryptographic rules. The Manager, the Crypto ETFs' Manager and Sub-Adviser make no guarantees about the reliability of the cryptography used to create, issue, or transmit the Digital Assets, which are held by the Crypto ETFs.

Effects of Blockchain Analytics

The Digital Assets utilize public blockchains on which all transactions are publicly viewable and which contain certain information about the transactions, such as the public wallet addresses and amounts involved. Accordingly, the

Digital Assets can be traced through statistical analysis, big data and by imposing an accounting convention such as “last in, first out” or “first in, first out.” These methods are commonly referred to as “blockchain analytics.” The fact that blockchain analytics can be performed implies that the Digital Assets are not perfectly fungible because prospective purchasers can theoretically discriminate against a Digital Asset by making certain assumptions about its particular transaction history in light of any legal risks associated with holding “tainted” currency, as the legal framework protecting fungibility of government-issued currency does not clearly apply to the Digital Assets. Potential risks include (i) a holder being exposed to conversion tort liability if a Digital Asset was previously stolen or (ii) a digital asset trading platform refusing to exchange a Digital Asset for government-issued currency on anti-money laundering or economic sanctions grounds. These concerns are exacerbated by the publication of Digital Asset address “blacklists,” such as the one published by the U.S. Treasury’s Office of Foreign Assets Control (OFAC).

Though the market currently does not apply discounts or premia to the Digital Assets in this manner, if the risks noted above, or similar risks, begin to materialize, then blockchain analytics could lead to disruptions in the market. For example, if a digital asset trading platform begins to discriminate based on transaction history, individual units of another Digital Asset could begin to have disparate value, possibly based on “grades” that are calculated based on factors such as age, transaction history and/or relative distance from flagged transactions or blacklisted addresses. Such developments could become a substantial limiting factor on a Digital Asset’s usefulness as a currency, and serve to reduce the value of, or restrict the applicable Crypto ETF’s ability to liquidate the Digital Asset held in its portfolio.

Faulty Code

In the past, flaws in the source code for Digital Assets have been exposed and exploited, including those that exposed users’ personal information and/or resulted in the theft of users’ Digital Assets. Several errors and defects have been publicly found and corrected, including those that disabled some functionality for users and exposed users’ personal information. Discovery of flaws in, or exploitations of, the source code that allow malicious actors to take or create money in contravention of known network rules have occurred. In addition, the cryptography underlying the Digital Assets could prove to be flawed or ineffective, or developments in mathematics and/or technology, including advances in digital computing, algebraic geometry and quantum computing, could result in such cryptography becoming ineffective. In any of these circumstances, a malicious actor may be able to steal the Digital Assets, which would adversely affect an investment in the units of the Funds. Any reduction in confidence in the source code or cryptography of the underlying Digital Assets generally could negatively impact the demand for the Digital Assets and therefore adversely affect the prices of the Digital Assets and an investment in the Funds.

Gateway Protocol Hijackings

Digital assets are also susceptible to Border Gateway Protocol hijacking, or BGP hijacking. Such an attack can be a very effective way for an attacker to intercept traffic en route to a legitimate destination. BGP hijacking impacts the way different nodes and miners are connected to one another to isolate portions of them from the remainder of the network, which could lead to a risk of the network allowing double-spending and other security issues. If BGP hijacking occurs on the Networks, participants may lose faith in the security of the Digital Assets, which could affect the Digital Assets’ values and consequently the value of the units of the Funds.

Any future attacks that impact the ability to transfer the Digital Assets could have a material adverse effect on the prices of the Digital Assets and the value of an investment in the units of the Funds.

Internet Disruptions

A significant disruption in internet connectivity could disrupt the Networks’ operations until the disruption is resolved, and such disruption could have an adverse effect on the price of the Digital Assets. In particular, some digital assets have experienced a number of denial-of-service attacks, which have led to temporary delays in block creation and digital asset transfers. While in certain cases in response to an attack, an additional “hard fork” has been introduced to increase the cost of certain Network functions, the relevant Network has continued to be the subject of additional attacks. Moreover, it is possible that as the Digital Assets increase in value, they may become bigger targets for hackers and subject to more frequent hacking and denial-of-service attacks.

Irrevocable Nature of Blockchain-Recorded Transactions

Digital Asset transactions recorded on the applicable blockchain are not, from an administrative perspective, reversible without the consent and active participation of the recipient of the transaction or, in theory, control or consent of a majority of the applicable Network's aggregate hashrate. Once a transaction has been verified and recorded in a block that is added to the applicable blockchain, an incorrect transfer of the Digital Asset or a theft of the Digital Asset generally will not be reversible, and the applicable Crypto ETF may not be capable of seeking compensation for any such transfer or theft. It is possible that, through computer or human error, or through theft or criminal action, the Digital Assets of a Crypto ETF could be transferred from custody accounts in incorrect quantities or to unauthorized third parties. To the extent that the Manager or Sub-Adviser of a Crypto ETF is unable to seek a corrective transaction with such third party or is incapable of identifying the third party that has received the Crypto ETF's Digital Asset through error or theft, the Crypto ETF will be unable to revert or otherwise recover incorrectly transferred Digital Asset. To the extent that the Crypto ETFs are unable to seek redress for such error or theft, such loss could adversely affect an investment in the Funds.

Insurance

Neither the Crypto ETFs nor their Custodians will maintain insurance against risk of loss of the Digital Assets held by the Crypto ETFs, as such insurance is not currently available in Canada on economically reasonable terms. The Sub-Custodian(s) of the Crypto ETFs maintain appropriate insurance coverage for Digital Assets held in their respective cold storage system, as well as commercial crime insurance in respect of Digital Assets held in hot storage. However, the amounts and continuous availability of such coverage are subject to change at the sole discretion of the Crypto ETFs' Sub-Custodian(s). The Digital Assets of the Crypto ETFs are generally held in cold storage vaults only, except for the Digital Assets held in hot storage on a temporary basis to facilitate portfolio transactions, or deposits and redemptions. To date, the Sub-Custodian(s) of the Crypto ETFs' have not experienced a loss due to unauthorized access from its hot wallet or cold storage vaults.

Intellectual Property

Code underlying the Networks is available under open source licenses and as such the code is generally open to use by the public. Nonetheless, other third parties may assert intellectual property claims relating to the holding and transfer of the Digital Assets and their source code. Regardless of the merit of any intellectual property or other legal action, any threatened action that reduces confidence in long-term viability or the ability of end-users to hold and transfer the Digital Assets may adversely affect the prices of the Digital Assets and an investment in the Funds. Additionally, a meritorious intellectual property claim could prevent the Crypto ETFs and other end-users from accessing, holding, or transferring the Digital Assets, which could force the liquidation of the Crypto ETFs' holdings of the Digital Assets (if such liquidation is possible). As a result, an intellectual property claim against the Crypto ETFs or other large Network participants could adversely affect the NAV of the Crypto ETFs and an investment in the Funds.

Limited Use

Use of the Digital Assets as a means of payment for goods and services remains limited. Price volatility undermines a Digital Asset's utility as a medium of exchange and its use as a medium of exchange and payment method may always be low. A lack of continued growth as a medium of exchange and payment method, or a contraction of such use, as well as a lack of adoption of the Networks, may result in increased volatility or a reduction in the value of the Digital Assets, either of which could adversely affect an investment in the Funds. There can be no assurance that such acceptance will grow, or not decline, in the future.

Liquidity Constraints on Digital Asset Trading Platforms

While the liquidity and traded volume of the Digital Assets are continually growing, they are still maturing assets. The Crypto ETFs may not always be able to acquire or liquidate their assets at a desired price. It may become difficult to execute a trade at a specific price when there is a relatively small volume of buy and sell orders in the marketplace, including on digital asset trading platforms. When transacting in the applicable Digital Asset's markets, the Crypto ETFs will be competing for liquidity with other large investors, including speculators, miners, other investment funds and institutional investors.

Unexpected market illiquidity, and other conditions beyond the control of the Manager, may cause major losses to the holders of a cryptocurrency or digital asset, including the Digital Assets. The large position in the Digital Assets that the Crypto ETFs may acquire increases the risks of illiquidity by making the Digital Assets difficult to liquidate. In addition, liquidation of significant amounts of the Digital Assets by the Crypto ETFs may impact the market prices of the Digital Assets.

Malicious Attacks on the Networks

Digital asset networks, including the Networks, are subject to control by entities that capture a significant amount of the applicable Network's processing power or a significant number of developers important for the operation and maintenance of such Network.

Mining Incentives

Miners generate revenue from both newly created Digital Asset, known as the "block reward" and from fees taken upon verification of transactions. If the aggregate revenue from transaction fees and the block reward is not sufficient to support the miner's ongoing operating costs, the miner may cease operations. If the award of new Digital Asset for solving blocks declines and/or the difficulty of solving blocks increases, and transaction fees voluntarily paid by participants are not sufficiently high, miners may not have an adequate incentive to continue mining and may cease their mining operations.

If miners cease operations, that would reduce the collective processing power on the applicable Network, which would adversely affect the confirmation process for transactions (i.e., temporarily decreasing the speed at which blocks are added to the blockchain until the next scheduled adjustment in difficulty for block solutions) and make the applicable Network more vulnerable to a malicious actor or botnet obtaining sufficient control to manipulate the blockchain and hinder transactions. Any reduction in confidence in the confirmation process or processing power of a Network may adversely affect the prices of the Digital Assets and an investment in the Funds.

Mining Collusion

Miners, functioning in their transaction confirmation capacity, collect fees for each transaction they confirm. Miners validate unconfirmed transactions by adding the previously unconfirmed transactions to new blocks in the blockchain. Miners are not forced to confirm any specific transaction, but they are economically incentivized to confirm valid transactions as a means of collecting fees. Miners have historically accepted relatively low transaction confirmation fees. If miners collude in an anticompetitive manner to reject low transaction fees, then Digital Asset users could be forced to pay higher fees, which could result in reduced confidence in, and use of, the Networks. Any collusion among miners may adversely impact the attractiveness of the Networks and may adversely impact the NAV of the Funds and an investment in their units or the ability of the Crypto ETFs to operate.

Momentum Pricing

The market value of the units in the Funds may be affected by momentum pricing of the Digital Assets due to speculation regarding future appreciation in value. Momentum pricing typically is associated with growth stocks and other assets whose valuation, as determined by the investing public, is impacted by anticipated future appreciation in value. Momentum pricing may result in speculation regarding future appreciation in the value of Digital Assets, which inflates prices and may lead to increased volatility.

Network Development and Support

The Networks operate based on open-source protocol maintained by a group of core developers. As the applicable Network protocol is not sold and its use does not generate revenues for development teams, core developers may not be directly compensated for maintaining and updating the Network protocol. Consequently, developers may lack a financial incentive to maintain or develop the Networks, and the core developers may lack the resources to adequately address emerging issues with the Networks. There can be no guarantee that developer support will continue or be sufficient in the future. Additionally, some development and developers are funded by companies whose interests may be at odds with other participants in the Networks or with the Funds. To the extent that material issues arise with the Network protocols and the core developers and open-source contributors are unable

or unwilling to address the issues adequately or in a timely manner, the Networks, the prices of the Digital Assets and an investment in the Funds may be adversely affected.

Network Forks

Each of the Digital Asset's software is open source, meaning that any user can download the applicable software, modify it and then propose that the users and miners of Digital Assets adopt the modification. When a modification is introduced and a substantial majority of users and miners consent to the modification, the change is implemented and the applicable Network remains uninterrupted. However, if less than a substantial majority of users and miners consent to the proposed modification, and the modification is not compatible with the software prior to its modification, the result is a so-called "*fork*" of the applicable Network. In other words, two incompatible networks would then exist: (1) one network running the pre-modified software and (2) another network running the modified software. The effect of such a fork would be the existence of two versions of a Digital Asset running in parallel, yet lacking interchangeability.

Forks occur for a variety of reasons and have occurred with the Digital Assets as well as other cryptocurrencies. First, forks may occur after a significant security breach. For example, in 2016, a smart contract using the Ethereum Network was hacked by an anonymous hacker, who syphoned approximately \$50 million worth of ETH held by the DAO, a distributed autonomous organization, into a segregated account. As a result of this event, most participants in the Ethereum ecosystem elected to adopt a proposed fork designed to effectively reverse the hack. However, a minority of users continued to develop the old blockchain, now referred to as "*Ethereum Classic*", with the digital asset on that blockchain now referred to as Classic ETH or ETC. Classic ETH remains traded on several digital asset exchanges.

Second, forks could be introduced by an unintentional, unanticipated software flaw in the multiple versions of otherwise compatible software users run. Such a fork could adversely affect the digital asset's viability. It is possible, however, that a substantial number of users and miners could adopt an incompatible version of the digital asset while resisting community-led efforts to merge the two chains. This would result in a permanent fork, as in the case of ETH and Classic ETH, as detailed above. If a permanent fork were to occur, then a Crypto ETF could hold amounts of the applicable Digital Asset and the new alternative. As described below, a Crypto ETF will hold the applicable Digital Asset, the new alternative, or both, based on its Manager and Sub-Adviser's sole discretion as to whether the new alternative is an appropriate medium for investment.

Third, forks may occur as a result of disagreement among network participants as to whether a proposed modification to the network should be accepted. For example, in July 2017, Bitcoin "*forked*" into Bitcoin and a new digital asset, Bitcoin Cash, as a result of a several-year dispute over how to increase the rate of transactions that the BTC Network can process. Since then, Bitcoin has been forked several times to launch new digital assets, such as Bitcoin Gold, Bitcoin Silver and Bitcoin Diamond.

Furthermore, certain forks can introduce new security risks. For example, when ETH and Classic ETH split in 2016, "*replay attacks*" (i.e., attacks in which transactions from one network were rebroadcast to nefarious effect on the other network) plagued digital asset platforms for a period of at least a few months.

Another possible result of a hard fork is an inherent decrease in the level of security. After a hard fork, it may become easier for an individual miner or mining pool's hashing power to exceed 50% of the processing power of the digital asset network, thereby making digital assets that rely on proof of work more susceptible to attack. See "*Malicious Attacks on the Network*".

If a Digital Asset were to fork into two digital assets, the applicable Crypto ETF would be expected to hold an equivalent amount of the Digital Asset and new asset following the hard fork. However, the Crypto ETF may not be able, or it may not be practical, to secure or realize the economic benefit of the new asset for various reasons. For instance, the Crypto ETF's Custodian, Sub-Custodian(s) or a security service provider may not agree to provide the Crypto ETF access to the new asset. In addition, the Crypto ETF may determine that there is no safe or practical way to custody the new asset, or that trying to do so may pose an unacceptable risk to the Crypto ETF's holdings in the Digital Asset, or that the costs of taking possession and/or maintaining ownership of the new digital asset exceed the benefits of owning the new digital asset.

The timing of any such occurrence is uncertain, and the Crypto ETF's Manager and Sub-Adviser has sole discretion whether to claim a new asset created through a fork of a Network, subject to certain restrictions that may be put in place by the Crypto ETF's service providers.

Forks in a Network could adversely affect the NAV of the Fund and an investment in its units or the ability of the Crypto ETF to operate. Additionally, laws, regulation or other factors may prevent the Crypto ETF from benefitting from the new asset even if there is a safe and practical way to custody and secure the new asset. For example, it may be illegal for the Crypto ETF to sell the new asset, or there may not be a suitable market into which the Crypto ETF can sell the new asset (either immediately after the fork or ever).

Network Governance

Governance of decentralized networks, such as the Networks, is achieved through voluntary consensus and open competition. In other words, the Digital Assets have no central decision-making body or clear manner in which participants can come to an agreement other than through overwhelming consensus. The lack of clarity on governance may adversely affect the Digital Assets' utility and ability to grow and face challenges, both of which may require solutions and directed effort to overcome problems, especially long-term problems.

Should a lack of clarity in the Networks' governance slow the Networks' development and growth, the prices of the Digital Assets and an investment in the Funds may be adversely affected.

Other Digital Asset Investment Funds

The Funds will compete with other current and future financial vehicles and investment funds that offer economic exposure to the price of the Digital Assets. Such competitors may invest in the Digital Assets, including through securities backed by or linked to the Digital Assets, such as exchange-traded products (or ETPs). Other competitors may invest in derivative financial products, which utilize a Digital Asset as the underlying asset. Market and financial conditions, and other conditions beyond a Fund's control, may make it more attractive for investors to redeem or sell units of a Fund in order to invest in other such financial vehicles, which could adversely affect unitholders who continue to hold the units. Furthermore, more attractive investment products not currently on the market could develop, which may also lead to investors redeeming or selling their units.

If other financial vehicles or investment funds tracking the price of Digital Assets are formed and come to represent a significant proportion of the demand for such Digital Assets, large redemptions of the securities of such competitors could result in large scale Digital Asset liquidations. This could, in turn, negatively affect the Digital Asset's prices, a Crypto ETF's holdings of the Digital Asset and the NAV of a Fund. In addition, these financial vehicles and other entities with substantial holdings in a Digital Asset may engage in large-scale hedging, sales or distributions which could also negatively impact the NAV of a Fund.

Price Fluctuation

The price of a security of an investment fund will generally vary with the value of the assets it directly or indirectly holds. A Crypto ETF or its indirect holdings in a Digital Asset, as applicable, is designed to mirror as closely as possible the performance of the price of the Digital Asset in which it invests. The prices of Digital Assets have fluctuated significantly over the past several years. Changes in global supply and demand, global or regional political, regulatory, economic or financial events and situations, especially those unexpected in nature, pandemics, investor expectations with respect to inflation, currency exchange rates, investment and trading activities of commodity funds may influence the value of the Digital Assets directly or indirectly held by the Crypto ETFs. When a unitholder redeems units, their value may be less than the unitholder's original investment.

Private Keys

The Digital Assets' private keys are stored in two different forms: "hot wallet" storage, whereby the private keys are connected to the internet, and "cold" storage, where private keys are stored completely offline. The Digital Assets held by the Sub-Custodian(s) for the Crypto ETFs are generally stored offline in cold storage only, except for the Digital Assets held in hot storage on a temporary basis to facilitate portfolio transactions, or deposits and redemptions. Private keys for the Digital Assets held by the Crypto ETFs must be safeguarded and kept private in order to prevent a third party from accessing the digital asset while held in such wallet. To the extent a private key

is lost, destroyed or otherwise compromised and no backup of the private key is accessible, the Crypto ETFs will be unable to access, and will effectively lose, the Digital Assets held in the related digital wallets. Any loss of private keys by a Sub-Custodian(s) of a Crypto ETF relating to digital wallets used to store the Crypto ETF's Digital Asset would adversely affect an investment in the applicable Funds.

Reliance on the Manager, the Sub-Adviser and/or a Sub-Custodian

Unitholders will be dependent on the abilities of the Manager, the Sub-Adviser and/or a Sub-Custodian, to effectively administer the affairs and implement the investment objective and strategy of a Crypto ETF and/or on a Sub-Custodian to safely custody a Crypto ETF's Digital Asset. The Sub-Adviser depends, to a great extent, on a very limited number of individuals in the administration of its activities as Sub-Adviser of the Crypto ETFs. The loss of the services of any one of these individuals for any reason could impair the ability of the Sub-Adviser to perform its duties as Sub-Adviser on behalf of the Crypto ETFs. If a Sub-Custodian did not adequately safeguard a Crypto ETF's Digital Asset, the Crypto ETF could suffer significant losses.

Residency of the Sub-Adviser and the Sub-Custodians

The Sub-Adviser and the Sub-Custodians are resident outside of Canada and all or a substantial portion of their assets are located outside Canada. As a result, anyone, including a Crypto ETF, seeking to enforce legal rights against the Sub-Adviser or the Sub-Custodians in Canada may find it difficult to do so.

Risks of Political or Economic Crises

Political or economic crises may motivate large-scale sales of the Digital Assets and other cryptocurrencies, which could result in a reduction in the prices of the Digital Assets and adversely affect an investment in the Funds. As an alternative to fiat currencies that are backed by central governments, cryptocurrencies, such as the Digital Assets, which are relatively new, are subject to supply and demand forces based upon the desirability of an alternative, decentralized means of buying and selling goods and services, and it is unclear how such supply and demand will be affected by geopolitical events. Nevertheless, political or economic crises may motivate large-scale acquisitions or sales of the Digital Assets either globally or locally. Large-scale sales of Digital Assets would result in a reduction in the price and adversely affect an investment in the Funds.

Risks Related to the Pricing Source

The Digital Assets held by the Crypto ETFs are valued, including for purposes of determining the NAV, based upon the Crypto ETFs' respective reference index. The portfolio of CI Galaxy Bitcoin ETF, the Crypto ETF for CI Bitcoin Fund, is priced based on the Bloomberg Galaxy Bitcoin Index ("BTC Index"). The portfolio of CI Galaxy Ethereum ETF, the Crypto ETF for CI Ethereum Fund, is priced based on the Bloomberg Galaxy Ethereum Index ("ETH Index"). The portfolio of CI Galaxy Solana ETF, the Crypto ETF for CI Solana Fund, is priced based on the Bloomberg Galaxy Solana Index ("SOL Index" and, collectively with BTC Index, and ETH Index the "Indexes"). The Indexes are calculated using Bloomberg Index Services Limited's Bloomberg Digital Asset Research ("DAR") as their primary input. DAR is a pricing algorithm using a time-weighted average price derived from eligible non-outlier trades that occur within a 30-minute window prior to a specified close time.

As each Index is calculated as an average of those pricing sources selected by Bloomberg Index Services Limited, it will not necessarily be reflective of the price of the applicable Digital Asset available on any given trading platform or other venue where a Crypto ETF's trades are executed. In addition, the Indexes are available once per day, whereas the Digital Assets trade 24 hours a day. As such, the Indexes may not be reflective of market events and other developments that occur after their pricing windows and thus the Indexes may not be reflective of the then-available market price of the Digital Assets in periods between their calculations. The Manager does not intend, and disclaims any obligation, to determine whether the Indexes reflect the realizable market value of the Digital Assets or the price at which market transactions in the Digital Assets could be readily affected at any given time.

To the extent that a Fund invests in a Crypto ETF, the Fund's NAV is based almost entirely on the value of the applicable Crypto ETF's Digital Asset portfolio as determined by reference to the applicable Index, and redemptions and subscriptions of the Funds are valued based on the NAV per unit of such Crypto ETFs, if the Indexes do not reflect the realizable market value of the Digital Assets, at a given time, redemption or subscriptions will be effected at prices that may adversely affect unitholders and the Funds.

Scaling Obstacles

Many digital asset networks face significant scaling challenges. As the use of digital asset networks increases without a corresponding increase in throughput of the Networks, average fees and settlement times can increase significantly. The Networks have been, at times, at capacity, which has led to increased transaction fees and decreased settlement speeds.

Increased fees and decreased settlement speeds could preclude certain use cases for the Digital Assets and could reduce demand for and the prices of the Digital Assets, which could adversely impact an investment in the Funds.

There is no guarantee that any of the mechanisms in place or being explored for increasing the scale of settlement of transactions in the Digital Assets will be effective, or how long these mechanisms will take to become effective, which could adversely impact the prices of the Digital Assets and an investment in the Funds.

Service Providers are Not Fiduciaries

The service providers, including Custodians and Sub-Custodians, that a Crypto ETF employs or may employ in the future are not trustees for, and owe no fiduciary duties to, the Crypto ETF or the unitholders. In addition, service providers employed by a Crypto ETF have no duty to continue to act as a service provider to the Crypto ETF. Current or future service providers, including Custodians and Sub-Custodians, can terminate their role for any reason whatsoever upon the notice period provided under the relevant agreement. A service provider may also be terminated by the Manager.

SOC 1 Type 2 and/or SOC 2 Type 2 Report of the Sub-Custodians

Each Crypto ETF has advised the Manager that a SOC 1 Type 2 and/or SOC 2 Type 2 Report of its internal controls will be available for review by the auditor of these ETFs in connection with the audit of the annual financial statements of an ETF. However, there is a risk that such SOC 1 Type 2 and/or SOC 2 Type 2 Report of a Sub-Custodian will not be available. In the event that a SOC 1 Type 2 and/or SOC 2 Type 2 Report is not available, the Manager will request confirmation from the Sub-Custodian in writing to permit the auditor of these ETFs to test its internal controls. Although the Manager has received reasonable assurances from Cidel Custodian and each Sub-Custodian that such written confirmation will be provided, in the event that a SOC 1 Type 2 and/or SOC 2 Type 2 Report of a Sub-Custodian is not available, there is a risk that such written confirmation will not be provided and/or that the auditor will not be able to test the internal controls of Cidel Custodian and the Sub-Custodian directly. Each ETF has filed an undertaking with applicable securities regulatory authorities that provides that while it remains a reporting issuer, the ETF will obtain from each Sub-Custodian of the ETF either a SOC 1 Type 2 and/or SOC 2 Type 2 Report or written confirmation from the Sub-Custodian to permit the auditor of the ETF to test its controls.

In the event that the auditor of an ETF cannot: (i) review a SOC 1 Type 2 and/or SOC 2 Type 2 Report of a Sub-Custodian; or (ii) test the internal controls of a Sub-Custodian directly in connection with its audit of the ETF's annual financial statements, the auditor would not be able to complete its audit of the annual financial statements of the ETF in accordance with the current guidance of the Canadian Public Accountability Board.

Standard of Care

Each of the Manager, the Sub-Adviser, Cidel Custodian and/or Sub-Custodian, or the Manager, the Sub-Adviser, the Custodian and/or Sub-Custodian of the Crypto ETFs, as applicable, are subject to a contractual standard of care in carrying out its duties with respect to the applicable Crypto ETF. If a Crypto ETF suffers a loss of its Digital Asset and each of the Manager, the Sub-Adviser, Cidel Custodian and/or Sub-Custodian, or the Manager, the Sub-Adviser, the Custodian and/or Sub-Custodian of the Crypto ETFs, satisfied its respective standard of care, the Crypto ETF will bear the risk of such loss with respect to such parties.

Under the terms of the custodian agreement of the Crypto ETFs, each Custodian is required to exercise the standard of care applicable to Custodians under National Instrument 81-102 *Investment Funds* ("NI 81-102"). However, Cidel Custodian or CIBC Mellon Custodian will not be liable to a Crypto ETF for any loss of the Crypto ETF's Digital Assets held by a Sub-Custodian unless such loss is directly caused by Cidel Custodian's or CIBC Mellon Custodian's gross negligence, fraud, wilful default, or the breach of its standard of care. In the event of such loss, Cidel Custodian or

CIBC Mellon Custodian, as applicable, is required to take reasonable steps to enforce such rights as it may have against a Sub-Custodian pursuant to the terms of the applicable Sub-Custodian agreement.

Settlement of Transactions on the Networks

There is no central clearing house for cash-to-Digital Asset transactions. Current practice is for the purchaser of a Digital Asset to send fiat currency to a bank account designated by the seller, and for the seller to broadcast the transfer of the Digital Asset to the purchaser's public Digital Asset address upon receipt of the cash. The purchaser and seller monitor the transfer with a transaction identification number that is available immediately upon transfer and is expected to be included in the next block confirmation. When a Crypto ETF purchases the applicable Digital Asset from a Digital Asset source, there is a risk that the Digital Asset source will not initiate the transfer on the applicable Network upon receipt of cash from the Crypto ETF, or that the bank where the Digital Asset source's account is located will not credit the incoming cash from the Crypto ETF for the account of the Digital Asset source. The Crypto ETFs seek to mitigate this risk by transacting with regulated Digital Asset sources that have undergone due diligence and by confirming the solvency of the applicable Digital Asset source and the bank designated by each Digital Asset source based on publicly available information.

Short History Risk

The Digital Assets are new technological innovations with a limited history. Due to their short history, it is not clear how all elements of the Digital Assets will unfold over time, specifically with regard to governance between miners, developers and users, as well as the long-term security model as the rate of inflation of the Digital Assets decreases. There is no assurance that usage of the Digital Assets and their blockchains will continue to grow. A contraction in the use of the Digital Assets or their blockchains may result in increased volatility or a reduction in the prices of the Digital Assets which could have a material adverse effect on an investment in the Funds.

Significant Energy Consumption to Run the Networks

Mining the Digital Assets requires significant computing power and the Networks' energy consumption may be deemed to be, or indeed become, unsustainable (barring improvements in efficiency which could be designed for the protocol). This could pose a risk to broader and sustained acceptance of the Networks as peer-to-peer transactional platforms, which may adversely impact the prices of the Digital Assets and an investment in the Funds.

Speculative Nature of Digital Assets

Investing in the Digital Assets is speculative, prices are volatile, and market movements are difficult to predict. Supply and demand for the Digital Assets can change rapidly and is affected by a variety of factors, including regulation and general economic trends.

Systems Risks

The Crypto ETFs depend on the Manager and the Sub-Adviser to develop and implement appropriate systems for the Crypto ETFs' activities. A Crypto ETF relies extensively on computer programs and systems to monitor its portfolio and net capital and to generate reports that are critical to the oversight of the Crypto ETF's activities. In addition, certain of the operations of the Manager and the Sub-Adviser interface with or depend on systems operated by third parties, including market counterparties and other service providers, and a Crypto ETF, the Manager or the Sub-Adviser may not be in a position to verify the risks or reliability of such third-party systems. These programs or systems may be subject to certain defects, failures, or interruptions, including, but not limited to, those caused by worms, viruses, and power failures. Any such defect or failure could have a material adverse effect on a Crypto ETF.

Technological Change

Large holders of the Digital Assets and digital asset trading platforms must adapt to technological change in order to secure and safeguard client accounts. The ability of the Crypto ETFs' Custodians to safeguard the Digital Assets that the Crypto ETFs hold from theft, loss, destruction or other issues relating to hackers and technological attack is based upon known technology and threats. As technological change occurs, such threats will likely adapt, and previously unknown threats may emerge. Furthermore, the Crypto ETFs may become more appealing targets of security threats as the size of a Crypto ETF's Digital Asset holdings grow. If the Manager, a Crypto ETF, its Sub-Adviser or Sub-Custodian(s) is unable to identify and mitigate or stop new security threats, a Crypto ETF's Digital Assets may be

subject to theft, loss, destruction or other attack, which could have a negative impact on the performance of the Funds or result in loss of such Crypto ETF's assets.

Unforeseeable Risks

The Digital Assets have gained commercial acceptance only within recent years and, as a result, there is little data on their long-term investment potential. Additionally, due to the rapidly evolving nature of the digital asset market, including advancements in the underlying technology, changes to the Digital Assets may expose investors in the Funds to additional risks which are impossible to predict as of the date of this simplified prospectus. This uncertainty makes an investment in the Funds very risky.

Unregulated Market Venues

Many digital assets trading platforms are not regulated as securities exchanges or commodity futures exchanges under the securities or commodity futures laws of Canada, the United States or other global jurisdictions. The venues through which the Digital Assets and other digital assets trade are new and, in many cases, largely unregulated. Furthermore, many such venues, including digital asset platforms and over-the-counter market venues, do not provide the public with significant information regarding their ownership structure, management teams, corporate practices or regulatory compliance. As a result, the marketplace may lose confidence in, or may experience problems relating to, these venues. These market venues may impose daily, weekly, monthly or customer-specific transaction or withdrawal limits or suspend withdrawals entirely, rendering the exchange of the Digital Assets for fiat currency difficult or impossible. Participation in these market venues requires users to take on credit risk by transferring the Digital Assets from a personal account to a third party's account.

Over the past several years, a number of digital asset trading platforms have been closed due to fraud, failure or security breaches. In many of these instances, the customers of such digital asset trading platforms were not compensated or made whole for the partial or complete losses of their account balances in such digital asset trading platforms. While smaller digital asset trading platforms are less likely to have the infrastructure and capitalization that make larger digital asset trading platforms more stable, larger digital asset trading platforms are more likely to be appealing targets for hackers and "malware" (i.e., software used or programmed by attackers to disrupt computer operation, gather sensitive information or gain access to private computer systems).

Furthermore, many digital asset trading platforms lack certain safeguards put in place by more traditional exchanges to enhance the stability of trading on the platform and prevent flash crashes, such as limit-down circuit breakers. As a result, the prices of Digital Assets on digital asset trading platforms may be subject to larger and/or more frequent sudden declines than assets traded on more traditional exchanges.

A lack of stability in digital asset trading platforms, manipulation of the Digital Assets markets by digital asset trading platform customers and/or the closure or temporary shutdown of such platforms due to fraud, business failure, hackers or malware, or government-mandated regulation may reduce confidence in the Digital Assets generally and result in greater volatility in the market prices of the Digital Assets. Furthermore, the closure or temporary shutdown of a digital asset trading platform may impact a Crypto ETF's ability to determine the value of its applicable Digital Asset holdings or to purchase or sell such Digital Asset(s). These potential consequences of a digital asset trading platform's failure or failure to prevent market manipulation could adversely affect the prices of the Digital Assets and an investment in the Funds.

Validator Incentives (applicable to all the Funds except CI Bitcoin Fund and CI Galaxy Bitcoin ETF)

Validators are rewarded for staking their ETH or SOL on the applicable Network, by earning a return based on factors such as the current token issuance or inflation rate (in the case of SOL), the total amount of SOL or ETH staked on the Network, activity on the applicable Network, and each individual validator's performance and commission structure. On the Solana Network, the SOL inflation rate is determined by an inflation schedule adopted by the SOL development community in February 2021—under this schedule, SOL inflation is currently 4.506% annually and will decrease 15% year-over-year until it reaches a long-term fixed rate of 1.5% annually. The Ethereum Network has a dynamic supply model, with new ETH issued as staking rewards and a portion of transaction fees removed from circulation, which may result in deflationary pressure depending on network usage. As SOL inflation declines or as more SOL or ETH is staked on either Network, the reward that each validator receives for verifying transactions may

decrease over time. If the aggregate revenue from validating transactions is not sufficient to support a validator's operating costs, the validator may cease operations. If validators cease operations, the applicable Network may experience reduced efficiency and reliability in transaction validation, heightening its vulnerability to manipulation or disruption by a malicious actor or botnet. Any reduction in confidence in the confirmation process of the applicable Network may adversely affect the price of ETH or SOL and an investment in the applicable Funds.

Volatility

The trading prices of the Digital Assets have experienced extreme volatility in recent periods and may continue to do so. The markets for the Digital Assets are sensitive to new developments, and since volumes are still maturing, any significant changes in market sentiment (by way of sensationalism in the media or otherwise) can induce large swings in volume and subsequent price changes. The value of the Digital Assets held by the Crypto ETFs could decline rapidly in future periods, including to zero.

Risk Factors Relating to ETH

Moving from Proof-of-Work (PoW) to Proof-of-Stake (PoS) Consensus Mechanism for the Ethereum Network

The Ethereum Network recently underwent a significant upgrade referred to as "*The Merge*" which occurred on September 15, 2022. The Merge was intended to improve the scalability and security of the Ethereum Network. It amended the consensus mechanism of the Ethereum Network, moving from a "*proof-of-work*" consensus mechanism to a "*proof-of-stake*" consensus mechanism. The Merge integrated the Ethereum mainnet (execution layer) with a separate consensus layer known as the Beacon Chain, eliminating the need for energy-intensive mining and enabling the network to be secured using staked ETH. Following The Merge, mining is no longer the mechanism for producing valid blocks. Instead, validators now propose blocks and validate transactions. Like mining, validating mints new ETH into circulation, but it requires a staked deposit and uses significantly less computational power, thereby lowering energy usage.

Future upgrades to the Ethereum Network are intended to further increase scalability and speed, particularly through the introduction of sharding, which is expected to allow the Ethereum blockchain to be split into parallel chains by distributing data processing across many nodes. The aim of this change is to allow the Ethereum Network to process a much greater number of transactions per second. While The Merge did not initially include the ability to withdraw staked ETH, that functionality was enabled following subsequent upgrades implemented on April 12, 2023.

The Ethereum Network includes upgrades and protocol modifications which may change the underlying structure, function, and relationship between Ethereum Network components, including the Ethereum mainnet, beacon chain, shard chains, and related blockchains or sub-chains. These changes may have a negative effect on the market value of ETH, and consequently negatively impact the NAV of the applicable Funds and an investment in their units.

Significant Increase in ETH or the Ethereum Network Use

One of the most contentious issues within the ETH community has been around how to scale the network as user demand continues to rise. It will be important for the community to continue to develop at a pace that meets the demand for transacting in ETH and on the Ethereum Network, otherwise users may become frustrated and lose faith in the network, which may in turn adversely affect the NAV of the applicable Fund, and/or lead to volatile NAV of such Funds. As a decentralized network, strong consensus and unity is particularly important for the Ethereum Network to respond to potential growth and scalability challenges.

Risk Factors Relating to SOL

Proof of History (PoH) Risks

The Solana Network uses a novel technology known as "*Proof of History*" or PoH, which is designed to allow transactions on the Solana Network to be timestamped and more quickly verified by providing a cryptographically safe source of time throughout the network, reducing the consensus overhead. While PoH, by facilitating rapid verification of transactions, represents a key component of the Solana Network's value proposition, the technology is relatively new and untested compared to more widely utilized technologies. As such, there may be an increased

chance of undiscovered issues with respect to the PoH protocol, which in turn could have an adverse effect on the Solana Network, the price of SOL and an investment in the applicable Funds.

Risk Factors Relating to Staking Arrangements

Due Diligence on the Ethereum and Solana Networks may be Insufficient Risk

In addition to conducting due diligence on staking, the Manager has conducted due diligence on how the Ethereum and Solana Networks operate and the staking mechanism for ETH and SOL. The Manager's review focused on, among other things, publicly available information concerning: (i) material technical risks associated with the applicable Network's staking mechanism, including any code defects, security breaches and other threats concerning the staking mechanism; (ii) the scope and applicability of slashing and other penalties; (iii) whether the staking mechanism used by the applicable Network could be efficiently integrated into the ETF's staking infrastructure; (iv) the legal and regulatory risks associated with the applicable Network's staking mechanism, including any pending, potential, or prior civil, regulatory, criminal or enforcement action relating to the issuance, distribution or use of ETH or SOL; (v) bonding and unbonding periods; (vi) limits on the number of active validators; (vii) the mechanism for selecting validators; and (viii) token inflation.

Should new information emerge indicating that the Manager's initial review of the applicable Network's staking mechanism failed to identify an unacceptable risk to the applicable Fund, the Manager may determine that it is prudent to discontinue the Staking Arrangements. The Manager's undertaking of these steps may occur concurrently with a rapid decline in the value of ETH or SOL and may also be a contributing factor to such decline. The applicable Fund may be subject to the risk that there may be very little liquidity in ETH or SOL while the Manager is undertaking these steps – especially if ETH or SOL continues to be staked or subject to unbonding periods.

Due Diligence on Staking Service Providers may be Insufficient Risk

The applicable Fund will be exposed to the risk of loss of staked ETH or SOL if the staking service provider selected to act as a validator fails to operate its network node(s) in accordance with the rules of the Ethereum Network or Solana Network, as ETH and SOL may be "*slashed*" or inactivity penalties may be applied if the validator node "*double signs*" or experiences extended downtime. Such Fund may also be prevented from obtaining rewards in respect of periods during which the validator is inactive on the applicable Network. The Manager and/or the Sub-Adviser intend(s) to mitigate these risks by conducting due diligence on staking service providers. In particular, the Manager and/or the Sub-Adviser intend(s) to consider the following factors in selecting staking service providers that provide validation services for Staking Arrangements:

- the persons that manage and direct the operations of the validator;
- the reputation of the validator and its use by others;
- the amount of crypto assets the validator has staked on its own nodes;
- the measures in place by the validator to operate the nodes securely and reliably;
- the financial status of the validator;
- the quality of the validator's work (i.e., the amount of downtime of the validator, past history of "*double signing*" and "*double attestation/voting*"); and
- any slashing penalties previously incurred by the validator.

Notwithstanding these efforts to mitigate risks related to malicious or incompetent validators, new facts may come to light which demonstrate that the Manager and/or the Sub-Adviser's initial assessment of a validator was flawed. In such instances, the applicable Fund may be subject to the risks identified in "*Slashing and Missed Rewards Risk*", and Staking Arrangements could be interrupted or disrupted. If the Manager and/or Sub-Adviser believe(s) that its initial assessment of a validator was flawed, it will likely seek out new service providers to assist it in providing Staking Arrangements, which could cause significant interruptions, disruptions or delays. In addition, notwithstanding the

occurrence of an event that demonstrates that the Manager and/or the Sub-Adviser's initial assessment of a validator was flawed, the ETH or SOL staked with that validator may still be subject to an unbonding period during which the applicable Fund will continue to have to rely on the services provided by such validator.

Earning Yield Through Staking Risk

Under a PoS protocol, token holders who voluntarily commit to staking are given the exclusive right to validate transactions and participate in consensus. Token holders can elect to stake their ETH or SOL in order to earn staked rewards, similar to a yield. Token holders of ETH or SOL can actively participate in the staking of their ETH or SOL by operating a validator node; for ETH, this requires a deposit of 32 ETH, whereas for SOL, there is no required minimum deposit. Alternatively, token holders can participate in staking by delegating their ETH or SOL to a validator node operated by another party. The applicable Fund will not operate validator nodes directly, but may delegate tokens to validators selected by the Manager and/or Sub-Adviser.

Validator nodes are selected randomly to validate transactions and earn staked ETH or SOL rewards for completing such validation. Approximately every 400-600 milliseconds, a new block is added to the Solana Network with the latest transactions processed by such Network, and the validator that generated this block is awarded SOL. Every 12 seconds, a new block is added to the Ethereum Network with the latest transactions processed by such Network, and the validator that generated this block is awarded ETH. Accordingly, there is not a competitive race to solve a mathematical puzzle that prevails in a PoW consensus mechanism. One important benefit of the PoS protocol is the reduction in computing power, computing equipment and energy usage. Independent estimates are that electricity usage has decreased by over 99.5% for PoS versus PoW, thus aligning with global initiatives for carbon emission reductions.

Fees are paid to validators that participate in the consensus and propose new blocks on the Ethereum and Solana Networks, and other validators earn much lower fees for attesting to each block. Validators perform both roles on a continuous basis and are called upon on a random basis. Validators perform such functions on their own behalf and not as agent for any owner of ETH or SOL that may delegate ETH or SOL to them, although rewards may also be received by owners of ETH or SOL that delegate the tokens to a validator.

The trading markets for ETH and SOL may be affected by the supply of ETH or SOL that is voluntarily committed to staking.

No Guarantee of Receiving Rewards Risk

Staking is similar in concept to a yield generation activity. However, staking is not a passive activity to the validator and requires the validator to engage in the active function of running validator software. Yields are paid in ETH or SOL and are variable depending, primarily, on the total amount of ETH or SOL staked to the applicable Network. These activities are expected to result in ETH or SOL-denominated staking income accruing to the applicable Fund in respect of ETH and SOL delegated to validators.

There is no guarantee that the applicable Fund will receive any rewards in respect of staked ETH or SOL. Past rewards are not indicative of future returns. The staking rewards that the applicable Fund may receive from staking ETH or SOL, if any, may be affected by, among other factors:

- the total amount of ETH or SOL staked by users of the applicable Network;
- the amount of ETH transaction fees paid during the produced block;
- the ETH base fee per block;
- the total amount of ETH or SOL staked pursuant to Staking Arrangements;
- changes to the applicable Network as a result of protocol governance decisions;
- changes to validator fees set by approved validators;
- anticipated or unanticipated downtime by approved validators;

- halts, outages or other anticipated or unanticipated interruptions affecting the applicable Network or validators involved in Staking Arrangements;
- “*slashing*” of ETH or SOL as a result of a violation of applicable Network rules by approved validators;
- validators ceasing to be eligible to participate in the applicable Network’s PoS mechanism and earn rewards;
- “*bonding*”, “*unbonding*” or other lock-up periods specified by the applicable Network;
- whether staking rewards are re-staked, either automatically by the applicable Network or as part of the operational processes of the Manager;
- re-delegation of the applicable Fund’s ETH or SOL to different validators; and
- delays or other operational factors related to or otherwise impacting Staking Arrangements.

Reliance on Third-Party Validators

Staking Arrangements could be disrupted if the third-party service providers selected to act as validators experience operational or other systems difficulties, terminate their services, fail to comply with regulations, or raise their prices. The Fund, as applicable, may also suffer the consequences of such service providers’ mistakes. For example, if the Sub-Custodians or any service providers selected to act as validators fail to behave as expected, suffer cybersecurity attacks, experience security issues or encounter other problems, the assets of the applicable Fund may be irretrievably lost. The failure or capacity restraints of service providers, a cybersecurity breach involving any service providers or the termination or change in terms or price of a service agreement on which the applicable Fund relies, could disrupt Staking Arrangements. Replacing service providers or addressing other issues with service providers could entail significant delay, expense and disruption for the applicable Fund. As a result, if these service providers (i) experience difficulties, (ii) are subject to cybersecurity breaches, (iii) terminate their services, (iv) dispute the terms of service agreements or (v) raise their prices, and the Manager is unable to replace them with other service providers, particularly on a timely basis, Staking Arrangements could be interrupted or disrupted.

Slashing and Missed Rewards Risk

The Ethereum and Solana Networks dictate requirements for participation in the relevant decentralized governance activity and may impose slashing penalties if the relevant activities are not performed correctly, for example, if the validator acts maliciously on the network, “*double signs*” any transactions or experiences extended downtime. If any service provider selected to act as validator for Staking Arrangements is slashed by the applicable Network, a variable amount of assets of the applicable Fund will be burned by the Network and irretrievable by the Fund. There is no assurance that the applicable Fund or any staking service providers will not be subject to slashing penalties or that the Fund will be able to recover any percentage of ETH or SOL that has been subject to slashing penalties.

Validator downtime incurs a minor inactivity penalty by the Ethereum Network or Solana Network not exceeding the activity reward earned when a validator is functioning correctly. Penalties incurred during downtime can be offset by the validator resuming its duties. During a period of extended downtime, the applicable Fund may also be prevented from obtaining rewards in respect of periods during which the validator is inactive on the applicable Network.

The Ethereum and Solana Networks also impose “*bonding*” periods on newly staked ETH or SOL during which staked ETH or SOL is ineligible for rewards. Once staking is initiated, a validator enters a queue to become “*activated*,” which takes approximately two days. During the bonding period, the staked assets of the applicable Fund will not be eligible to receive any staking rewards and may not be withdrawn.

Staking Timeline and Unbonding Periods Risk

Those who have staked ETH or SOL are able to withdraw their staked ETH or SOL and rewards from the applicable Network, however there are risks associated with withdrawing all or some of the staked ETH or SOL (“*unbonding*”). If the timing associated with the process of unbonding is for any reason delayed, the Manager will not be able to

withdraw or liquidate the staked ETH or SOL. If there is a delay in the unbonding of ETH or SOL, this may prevent the applicable Fund, from realizing the fiat value of the staked ETH or SOL and rewards earned on staked ETH or SOL during the unbonding period. Given the volatility of ETH and SOL, the value of the staked ETH or SOL at the time of completion of the unbonding period may be significantly less than the value of the ETH or SOL at the time a decision is taken to withdraw staked ETH or SOL. Such delay may adversely affect the business and liquidity of and the NAV per unit of the applicable Fund.

Risk Factors Relating to Hedged Series

Currency Hedging Risk

The use of currency hedges by a Fund involves special risks, including the possible default by the other party to the transaction, illiquidity and, to the extent the Manager and/or Sub-Advisers' assessment of certain market movements is incorrect, the risk that the use of hedges could result in losses greater than if the hedging had not been used. Hedging arrangements may have the effect of limiting or reducing the total returns to the Fund or a series of the Fund, if the Manager and/or Sub-Advisers' expectations concerning future events or market conditions prove to be incorrect. In addition, the costs associated with a hedging program may outweigh the benefits of the arrangements in such circumstances.

For regulatory and operational reasons, the Funds may not be able to fully hedge foreign currency exposure at all times in respect of the Hedged Series units. Although there is no assurance that these currency forward contracts will be effective, the Manager expects these currency forward contracts to be substantially effective. However, some deviations from the returns of the index are expected to occur as a result of the costs, risks or other performance impacts of this currency hedging strategy.

Hedged Series Risk

Certain Funds offer one or more Hedged Series to hedge against currency fluctuations between the currency of the Hedged Series and the base currency of the Fund (i.e., the Canadian-U.S. dollar exchange rate). Hedged Series are substantially hedged using derivative instruments such as forward foreign currency contracts. While it is not the Fund's intention, over-hedged or under-hedged positions may arise due to factors outside the control of the Fund. Where a Fund has both a Hedged Series and an equivalent unhedged series, Hedged Series aim to provide investors with a return correlated to the base currency performance of the Fund, but they do not offer the exact same return as their equivalent unhedged series of the same Fund.

Hedging transactions will be clearly attributable to a specified Hedged Series and, therefore, currency exposures of different Hedged Series may not be combined or offset. Although a Fund will maintain separate accounts or book entries with respect to each series of securities, separate series of a Fund are not separate legal entities and the assets and liabilities between Fund series will not be segregated. Accordingly, there is a risk that, under certain circumstances, currency hedging transactions in relation to one Hedged Series could result in liabilities which might affect the NAV of the other series of the same Fund.

Risk Factors Relating to an Investment in an ETF

Absence of an Active Market for the ETFs and Lack of Operating History Risk

Certain units of the ETFs may have limited operating history as exchange-traded funds. Although the units of the ETFs may be listed on the TSX, there can be no assurance that an active public market for the units will develop or be sustained.

The New ETF is a newly established investment trust with no operating history as an ETF. Although units of the New ETF may be listed on the TSX, there is no assurance that an active public market for the units will develop or be sustained.

Exchange Risk

In the event that the TSX closes early or unexpectedly on any day that it is normally open for trading, unitholders will be unable to purchase or sell units on the TSX until it reopens and there is a possibility that, at the same time and for the same reason, the exchange and redemption of units may be suspended until the TSX reopens.

Lack of Arbitrage Transactions

If the processes of creation and redemption of units of an ETF encounters any unanticipated difficulties, potential market participants, such as broker-dealers and their customers, who would otherwise be willing to purchase or redeem units of the ETF to take advantage of any arbitrage opportunity arising from discrepancies between the price of the units of the ETF, and the price of the underlying Digital Asset may not take the risk that, as a result of those difficulties, they may not be able to realize the profit they expect. If this is the case, the liquidity of the units of an ETF may decline, and the trading price of the ETF may fluctuate independently of the price of the Digital Asset(s) and may fall or otherwise diverge from the NAV of the units.

Large-Scale Sales or Distributions

Some entities hold large amounts of the Digital Assets relative to other market participants, and to the extent such entities engage in large-scale hedging, sales or distributions on non-market terms, or sales in the ordinary course, it could result in a reduction in the price of the Digital Assets and adversely affect an investment in the ETFs. Additionally, political or economic crises may motivate large-scale acquisitions or sales of such digital assets, including the Digital Assets, either globally or locally. Such large-scale sales or distributions could result in selling pressure that may reduce the price of the Digital Assets and adversely affect an investment in the funds.

Limited Designated Brokers Trade in Digital Assets

There are limited Designated Brokers and Dealers operating in the digital assets sector that trade in the Digital Assets. As the ETFs will only issue their units directly to Designated Brokers and Dealers, the inability to enter into agreements with Designated Brokers and Dealers that trade in the Digital Assets could adversely affect the ETFs.

Limited Operating History

The ETFs are investment trusts with limited operating history as exchange-traded funds. Although units of the ETFs, other than the New ETF, are currently listed on the TSX, there can be no assurance that an active public market for the units will be sustained.

Nature of Units

The units represent a fractional interest in the assets of an ETF. Unitholders will not have the statutory rights normally associated with ownership of shares of a corporation including, for example, the right to bring “oppression” or “derivative” actions.

Risks Related to Rules-Based Investment Strategy (applicable to CI Galaxy Multi-Crypto Navigator ETF)

A rules-based investment strategy will generate trend signals that rely on historical data. At times, rules-based models can generate unanticipated results that may impact the performance of a fund for a variety of reasons, including when markets behave in an unpredictable manner, errors or omissions in the data used by the model, and technical issues in the design, development, implementation and maintenance of the model. These funds may underperform other funds that do not use a rules-based investment strategy, including a passive investment fund and an actively managed fund.

Trading Price of Units

Units may trade in the market at a discount to the NAV per unit, and there can be no assurance that the units will trade at a price equal to (or greater than) the NAV per unit.

Potential purchasers may wish to consult with their own investment advisers for advice in connection with an investment in the Funds.

Specific Information About Each of the Funds Described in this Simplified Prospectus

The following is a guide on the various sections under each fund's profile starting on page 37, which also sets out information that is applicable or shared amongst the Funds.

Fund Details

This section gives you a snapshot of the Fund with information such as the Fund's start date, the series of units it offers and whether its units are qualified investments for registered plans.

What Does the Fund Invest In?

This section includes each Fund's investment objective and the strategies it uses in trying to achieve its objective. Any change to the fundamental investment objective must be approved by a majority of votes cast at a meeting of unitholders held for that reason. We may change a Fund's investment strategies at our discretion without notice or approval.

How the Funds engage in Staking Arrangements (applicable to CI Galaxy Ethereum ETF and CI Galaxy Solana ETF)

Subject to obtaining unitholder approval on or about August 20, 2025, the Manager proposes to implement a Staking Service Fee on or about August 27, 2025 in respect to CI Galaxy Ethereum ETF.

The Ethereum and Solana Networks enable holders to earn rewards by participating in transaction confirmation activities through a process known as "staking". Staking refers to Proof of Stake (PoS) consensus protocols, which are mechanisms for ensuring that transactions are properly recorded on a blockchain. Owners who stake a particular blockchain's native currency validate the block transactions (or may delegate the currency to others who validate block transactions), and validators with the most holdings (which may include assets "delegated" to them) are generally able to validate at a higher rate, proportional to their amount staked. The Ethereum and Solana Networks generally rely on "validators". Staking requires validators who engage in the active function of running validator software and equipment. Rewards are paid in the blockchain's native currency and are variable depending, primarily, on the total amount of the Digital Assets staked to the Network. Validators participating in a Network's PoS protocol (and owners of tokens who delegate them to validators) risk the loss of their staked Digital Asset in the event that such validators fail to comply with the rules of the Network (a process called slashing). By engaging in Staking Arrangements, the applicable ETF is exposed to the risk of losses caused by the validators to whom it delegates Digital Assets. While staking ETH requires a minimum of 32 ETH, there is no minimum deposit requirement for staking SOL.

Each of CI Galaxy Ethereum ETF (subject to unitholder approval of the Staking Service Fee) and CI Galaxy Solana ETF intends to stake a portion of its Digital Assets through one or more validators facilitated by the Sub-Custodians, which may include a validator affiliated with the Sub-Adviser (which would result in the payment of validator fees by the applicable ETF to such validator affiliated with the Sub-Adviser). The staking service providers will use hardware, software and other services necessary to establish validator nodes and stake the ETF's Digital Assets on the applicable Network. As a result of any Staking Arrangement in which the ETF may engage by delegating Digital Assets to a validator, the ETF expects to receive staking rewards of ETH or SOL, as applicable. In facilitating the ETF's Staking Arrangements, the Sub-Adviser will cause the ETH or SOL held in the ETF's portfolio to be staked through one or more staking service providers with experience acting as a validator. Prior to a staking service provider being allowed to act as validator, the Manager and/or Sub-Adviser will conduct due diligence on such staking service provider. The staking service provider exercises no discretion as to the amount of the ETF's Digital Assets to be staked or the timing of Staking Arrangements (other than as is incidental in establishing or deactivating validator nodes). The Sub-Custodians will maintain exclusive possession and control of the private keys associated with the cold storage wallet into which the ETF's staked Digital Assets may be unbonded, and into which staking rewards will be deposited, at all times. For clarity, when staking, the Sub-Adviser will exercise its discretion to direct the staked voting power of the ETF's staked Digital Assets to the validator(s) operated by one or more staking service providers.

as selected by the Sub-Adviser. The staked Digital Assets may only be unbonded to the cold storage wallets maintained by the Sub-Custodians, and all staking rewards will also be deposited to cold storage wallets.

The Sub-Adviser intends to initially use validators facilitated by the Sub-Custodians, which may include a validator affiliated with the Sub-Adviser. However, the Sub-Adviser or the Manager may in the future, at its discretion, engage an affiliate of the Manager to provide staking services to the ETF through such affiliate's proprietary staking software. Neither the Sub-Adviser nor the Manager will use an affiliate of the Manager as a staking service provider if the net commission rate charged to the ETF would be higher than what could be charged if an acceptable third-party staking service provider (including an affiliate of the Sub-Adviser) was used instead. In determining whether to use an affiliate of the Manager, the Sub-Adviser and the Manager will also consider all qualitative and quantitative factors including, but not limited to, the security of the validator and the staked ETH or SOL, the expected net staking yield of the validator, as well as the expected uptime of the validator in performing Staking Arrangements.

Staking Arrangements will generally occur as follows:

- the Manager will oversee the Staking Arrangements on a daily basis and initially intends to stake up to 50% of the ETH or SOL held in the portfolio of the applicable ETF;
- the Sub-Adviser will direct the Sub-Custodians to stake a certain amount of ETH or SOL through delegation to a validator directly out of the cold wallet administered by the Sub-Custodians on behalf of the applicable ETF;
- an affiliate of the Sub-Adviser may act as validator in respect of the staked ETH or SOL;
- rewards, which will be paid in ETH or SOL, as applicable, subject to any bonding or lock-up period, may be earned in connection with staking;
- the validator will be entitled to a fee in respect of the rewards; and
- the net rewards will be delivered to a custodial wallet of the applicable ETF held with the Sub-Custodians, a portion of which will be paid to the Manager as a Staking Service Fee, with the balance to be reinvested in the ETF.

Each of CI Galaxy Ethereum ETF and CI Galaxy Solana ETF intends to stake a portion of its Digital Assets from time to time and the Manager intends to adopt a measured approach to the Staking Arrangements, taking into account the liquidity needs of the applicable ETF, the novelty of the investment strategy, as well as any applicable regulatory requirements and approvals. The Manager intends to initially target staking up to 50% of the Digital Assets held in the portfolio of the applicable ETF.

Staking has become one of the most common technologies used by blockchains, including the Ethereum and Solana Networks, to secure their Networks. Unlike traditional digital currency mining, which is used to mine older blockchains like bitcoin, staking technology uses validation rights attached to Digital Asset ownership to make Digital Asset transactions secure, reliable and sustainable. Please see *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Risk Factors Relating to Staking Arrangements"* for the risks associated with staking.

Investment Restrictions

Except as described below, each of the Funds is subject to and follows the investment restrictions and requirements outlined in securities legislation, including NI 81-102 of the Canadian securities administrators. This helps to ensure that each fund's investments are diversified and relatively easy to trade. They also ensure proper administration of the Funds.

Tax Related Investment Restrictions

A Fund will not make an investment or conduct any activity that would result in the Fund (i) failing to qualify as a "unit trust" or "mutual fund trust" within the meaning of the Income Tax Act, (ii) being subject to the tax for "SIFT trusts" for purposes of the Income Tax Act (and the Manager intends to take the position that the acquisition, holding or staking of ETH or SOL will not result in a Fund being subject to such tax), or (iii) if it is or becomes a "registered investment" for purposes of the Income Tax Act acquiring an investment which is not a "qualified investment" under

the Income Tax Act if, as a result thereof, the Fund would become subject to a material amount of tax under Part X.2 of the Income Tax Act. In addition, a Fund will not (i) make or hold any investment in property that would be “*taxable Canadian property*” (if the definition of such term in the Income Tax Act were read without reference to paragraph (b) thereof) if more than 10% of the Fund’s property consisted of such property.

In addition, none of the Funds will (i) invest in or hold (a) securities of or an interest in any non-resident entity, an interest in or a right or option to acquire such property, or an interest in a partnership which holds any such property if the Fund (or the partnership) would be required to include significant amounts in income pursuant to section 94.1 of the Income Tax Act, (b) an interest in a trust (or a partnership which holds such an interest) which would require the Fund (or the partnership) to report significant amounts of income in connection with such interest pursuant to the rules in section 94.2 of the Income Tax Act, or (c) any interest in a non-resident trust other than an “*exempt foreign trust*” for the purposes of section 94 of the Income Tax Act (or a partnership which holds such an interest); (ii) invest in any security that would be a “*tax shelter investment*” within the meaning of section 143.2 of the Income Tax Act; or (iii) invest in any security of an issuer that would be a “*foreign affiliate*” of the Fund for purposes of the Income Tax Act.

In addition, a Fund may not enter into any arrangement (including the acquisition of securities for its portfolio) where the result is a “*dividend rental arrangement*” for the purposes of the Income Tax Act, and a Fund may not engage in securities lending that does not constitute a “*securities lending arrangement*” for purposes of the Income Tax Act.

Description of the Units Offered by the Funds

You will find a list of all of the series of units that the Funds offer on the front cover of this simplified prospectus, and a description of their features under “*Purchases, Switches and Redemptions*” in Part A of the simplified prospectus.

As an investor, you have the right to share in any distributions (other than management fee distributions and distributions paid in respect of a different series of units that are intended to constitute a return of capital) that the Funds make. You can sell your units and transfer from one fund to other mutual funds managed by the Manager at any time. If a Fund stops operating, you have the right to share in the Fund’s net assets after it has paid any outstanding debts. You can pledge your units as security, but you may not transfer or assign them to another party. Pledging units held in a registered plan may result in adverse tax consequences. The rights of unitholders may be modified by amending the Declaration of Trust (as defined herein) that established each fund.

You are entitled to receive notice of unitholder meetings, where you will have one vote for each whole unit you own. You have the right to vote on the following matters:

- a change in the method of calculating, or the introduction of, a fee or expense charged to the Fund if the change could increase the charges to the Fund or its unitholders;
- appointment of a new manager, unless the new manager is an affiliate of the current manager;
- a change in the Fund’s fundamental investment objective;
- any decrease in the frequency of calculating the NAV per unit of the Fund;
- in certain circumstances, a merger with, or transfer of assets to, another issuer if:
 - the Fund will be discontinued, and
 - investors in the discontinued fund will become investors in the other issuer;
- a merger with, or acquisition of assets from, another issuer if:
 - the Fund will continue;
 - investors in the other issuer will become investors in the Fund, and
 - the transaction would be a significant change to the Fund; and

- a restructuring of the Fund into a non-redeemable investment fund or into an issuer that is not an investment fund.

If you own units of any series of a Fund, you will be entitled to vote at any meeting of unitholders of that series, for example, to change the management fee payable by that series. You will also be entitled to vote at any meeting called that affects the Fund as a whole, for example, to change the investment objective of the Fund. A change to the fundamental investment objective of the Fund would require a majority of votes cast at a meeting of unitholders.

Each Fund that invests in an Underlying Fund managed by the Manager or its affiliates will not vote any of the securities it holds of the Underlying Funds. However, the Manager may arrange for you to vote your share of those securities.

Distribution Policy

If a Crypto Mutual Fund pays a distribution, it will be paid in the same currency in which you hold your units. **Generally, distributions are automatically reinvested, without charges, in additional units of the same Crypto Mutual Fund, unless you ask in writing to have them invested in another mutual fund managed by CI GAM. You can ask to receive your distributions in cash for funds you hold in non-registered accounts. Cash distributions are not subject to redemption fees.** We may change the distribution policy at our discretion. For more information about distributions, see *"Income Tax Considerations – Income Tax Considerations for Investors"* in Part A of the simplified prospectus.

It is not anticipated that the ETFs will make cash distributions. If an ETF's net income for tax purposes, including net realized capital gains, for any year exceeds the aggregate amount of the distributions made in the year to unitholders, if any, the ETF will be required to pay one or more special year-end distributions in such year to unitholders as is necessary to ensure that the ETF will not be liable for income tax on such amounts under the Income Tax Act (after taking into account all available deductions, credits and refunds). Such special distributions may be paid in the form of units and/or cash. Any special distributions payable in units of the applicable series will increase the aggregate adjusted cost base of a unitholder's units of such series. Immediately following payment of such a special distribution in units of the applicable series, the number of units of such series outstanding will be automatically consolidated such that the number of units outstanding after such distribution will be equal to the number of units outstanding immediately prior to such distribution, except in the case of a non-resident unitholder to the extent tax was required to be withheld in respect of the distribution. See *"Income Tax Considerations"*.

Year-End Distributions

If, in any taxation year, after the ordinary distributions, there would remain in a Fund additional net income or net realized capital gains, the Fund will be required to pay or make payable such net income and net realized capital gains as one or more special year-end distributions in such year to unitholders as is necessary to ensure that the Fund will not be liable for non-refundable income tax on such amounts under Part I of the Income Tax Act (after taking into account all available deductions, credits and refunds). Such special distributions may be paid in the form of units and/or cash. Any special distributions payable in units of a Fund will increase the aggregate adjusted cost base of a unitholder's units.

Name, Formation and History of the Funds

The address of the Funds is the same as that of CI GAM, which is:

15 York Street
Second Floor, Toronto Ontario
M5J 0A3

Each of the Funds has been established as a unit trust under the laws of Ontario pursuant to an amended and restated master declaration of trust dated April 21, 2020, as may be supplemented or amended from time to time (the **"Declaration of Trust"**). Each fund offers *"units"*. Each Fund shall have one class of units, within which there shall be one or more series of units issuable. The Declaration of Trust may be amended from time to time to add a

new mutual fund or a new series of units. The year-end of the Crypto Mutual Funds and the ETFs for financial reporting purposes is March 31 and December 31, respectively.

The following table sets out the dates of formation, former names and other major events affecting the Funds in the last 10 years:

Fund Name	Date of Formation	Former Names	Changes
CI Bitcoin Fund	March 31, 2021		
CI Ethereum Fund	April 22, 2021		
CI Solana Fund	July 15, 2025		
CI Galaxy Bitcoin ETF	March 4, 2021		
CI Galaxy Ethereum ETF	April 16, 2021		
CI Galaxy Core Multi-Crypto ETF	July 15, 2025		
CI Galaxy Multi-Crypto Navigator ETF	January 7, 2022	From CI Galaxy Multi-Crypto ETF to CI Galaxy Multi-Crypto Navigator ETF, July 15, 2025	

What are the Risks of Investing in the Fund?

This section shows the specific risks associated with an investment in the Fund, which are described in the section *“What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Types of Risks”*.

Risk Classification Methodology

We determine the risk level for each fund in accordance with a standardized risk classification methodology in NI 81-102 that is based on the mutual fund's historical volatility as measured by the 10-year standard deviation of the returns of the mutual fund. Standard deviation is a common statistic used to measure the volatility and risk of an investment. Mutual funds with higher standard deviations are generally classified as being more risky. Just as historical performance may not be indicative of future returns, a Fund's historical volatility may not be indicative of its future volatility. You should be aware that other types of risk, both measurable and non-measurable, also exist.

Where a Fund has offered units to the public for less than 10 years, the standardized methodology requires that the standard deviation of a reference fund or index that reasonably approximates or, for a newly established fund, is reasonably expected to approximate, the standard deviation of the Fund be used to determine the risk rating of the Fund. As the Funds that have not offered units to the public for at least 10 years, the applicable reference fund or index used to determine the risk rating for each Fund is displayed in the table at the end of this section.

Each fund is assigned an investment risk rating in one of the following categories:

- **Low** – this level of risk is typically associated with investments in money market funds and Canadian fixed income funds;
- **Low to Medium** – this level of risk is typically associated with investments in balanced funds and global and/or corporate fixed income funds;
- **Medium** – this level of risk is typically associated with investments in equity portfolios that are diversified among a number of large-capitalization Canadian and/or international equity securities;
- **Medium to High** – this level of risk is typically associated with investments in equity funds that may concentrate their investments in specific regions or in specific sectors of the economy; and

- **High** – this level of risk is typically associated with investment in equity portfolios that may concentrate their investments in specific regions or in specific sectors of the economy where there is a substantial risk of loss (e.g., emerging markets, precious metals).

Name of Fund	Reference Index	Reference Index Descriptions
CI Bitcoin Fund	Bloomberg Galaxy Bitcoin Index	The Bloomberg Galaxy Bitcoin Index is designed to measure the performance of a single BTC traded in U.S. dollars.
CI Ethereum Fund	Bloomberg Galaxy Ethereum Index	The Bloomberg Galaxy Ethereum Index is designed to measure the performance of a single ETH traded in U.S. dollars.
CI Solana Fund	Bloomberg Galaxy Solana Index	The Bloomberg Galaxy Solana Index is designed to measure the performance of a single SOL traded in U.S. dollars
CI Galaxy Bitcoin ETF	Bloomberg Galaxy Bitcoin Index	The Bloomberg Galaxy Bitcoin Index is designed to measure the performance of a single BTC traded in U.S. dollars.
CI Galaxy Ethereum ETF	Bloomberg Galaxy Ethereum Index	The Bloomberg Galaxy Ethereum Index is designed to measure the performance of a single ETH traded in U.S. dollars.
CI Galaxy Core Multi-Crypto ETF	Bloomberg Galaxy Bitcoin Index (70%) Bloomberg Galaxy Ethereum Index (15%) Bloomberg Galaxy Solana Index (15%)	The Bloomberg Galaxy Bitcoin Index is designed to measure the performance of a single BTC traded in U.S. dollars. The Bloomberg Galaxy Ethereum Index is designed to measure the performance of a single ETH traded in U.S. dollars. The Bloomberg Galaxy Solana Index is designed to measure the performance of a single SOL traded in U.S. dollars
CI Galaxy Multi-Crypto Navigator ETF	Bloomberg Galaxy Bitcoin Index (50%) Bloomberg Galaxy Ethereum Index (25%) Bloomberg Galaxy Solana Index (25%)	The Bloomberg Galaxy Bitcoin Index is designed to measure the performance of a single BTC traded in U.S. dollars. The Bloomberg Galaxy Ethereum Index is designed to measure the performance of a single ETH traded in U.S. dollars. The Bloomberg Galaxy Solana Index is designed to measure the performance of a single SOL traded in U.S. dollars

The Manager has assigned each fund a risk rating of high. Investors should consider their own risk profile (risk tolerance and capacity for risk) and speak with their adviser to determine if an investment in the Funds may be suitable for them.

There may be times when we believe the standardized methodology produces a result that does not reflect the Fund's risk based on other qualitative factors. As a result, we may place the Fund in a higher risk rating category, as appropriate. We review the risk rating for the Fund on an annual basis or if there has been a material change to the Fund's investment objectives or investment strategies. As part of our annual review, we also review our investment risk classification methodology and ensure that the reference funds or indices used for our calculations are appropriate.

The manner in which we identify risk is available on request, at no cost, by calling 1-800-792-9355 or by emailing service@ci.com.

What Does the Fund Invest In?

Investment Objective

The investment objective of the Fund is to provide unitholders exposure to bitcoin (“**BTC**”) through an institutional-quality fund platform.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the Fund will invest all or substantially all of its assets in CI Galaxy Bitcoin ETF (the “**ETF**”), an alternative mutual fund within the meaning of NI 81-102.

The ETF will invest directly in BTC and will utilize high-quality service providers in the digital assets sector (e.g., digital asset custodians, trading platforms and trading counterparties) in order to manage the assets of the ETF. The ETF’s portfolio is priced based on, and the NAV of the ETF is calculated using, the Bloomberg Galaxy Bitcoin Index (“**BTC Index**”) or such other index as the Manager may select from time to time, in its discretion. The BTC is designed to measure the performance of a single BTC traded in U.S. dollars and is owned and administered by Bloomberg Index Services Limited and is co-branded with the ETF’s portfolio sub-adviser, Galaxy Digital Capital Management LP. The BTC Index is calculated using Bloomberg Digital Asset Research (“**DAR**”) as its primary input. DAR is a pricing algorithm using a time-weighted average price derived from eligible, non-outlier trades that occur within a 30-minute window prior to a specified close time.

As it is the ETF’s intention to invest in BTC on a passive basis, the ETF’s holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of BTC declines or is expected to decline. The ETF may also hold cash and cash equivalents or other money market instruments in order to meet its obligations.

This document provides specific information about CI Bitcoin Fund. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

The ETF does not intend to use derivatives in connection with its investment strategy. Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire BTC for its portfolio. The ETF may however borrow money on a temporary short-term basis to acquire BTC in connection with a subscription for the ETF units by a dealer. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102

What are the Risks of Investing in the Fund?

During the 24-month period immediately preceding June 16, 2025, up to 100.00% of the net assets of the Fund were invested in units of CI Galaxy Bitcoin ETF. The associated risk is discussed in the section “*What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – General Risks – Concentration Risk*” in Part B of this simplified prospectus.

For a list of risk factors applicable to the Fund, please see “*What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Types of Risks*”.

Distribution Policy

Income and capital gains are distributed annually, if any, in December. For more information, see “*Description of the Units Offered by the Funds – Distribution Policy*”.

This document provides specific information about CI Bitcoin Fund. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. What Does the Fund Invest In?

Investment Objective

The investment objective of the Fund is to provide unitholders exposure to Ether (“**ETH**”) through an institutional-quality fund platform.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the Fund will invest all or substantially all of its assets in CI Galaxy Ethereum ETF (the “**ETF**”), an alternative mutual fund within the meaning of NI 81-102.

The ETF will invest directly in ETH and will utilize high-quality service providers in the digital assets sector (e.g., digital asset custodians, trading platforms and trading counterparties) in order to manage the assets of the ETF. The ETF’s portfolio is priced based on, and the NAV of the ETF is calculated using, the Bloomberg Galaxy Ethereum Index (“**ETH Index**”) or such other index as the Manager may select from time to time, in its discretion. The ETH Index is designed to measure the performance of a single ETH traded in U.S. dollars and is owned and administered by Bloomberg Index Services Limited and is co-branded with the ETF’s portfolio sub-adviser, Galaxy Digital Capital Management LP. The ETH Index is calculated using Bloomberg Digital Asset Research (“**DAR**”) as its primary input. DAR is a pricing algorithm using a time-weighted average price derived from eligible, non-outlier trades that occur within a 30-minute window prior to a specified close time.

Please note that the Manager of the ETF announced its intention to commence staking a portion of ETH held in the ETF’s portfolio (the “**Staking Arrangements**”) and proposed to implement a Staking Service Fee in association with such Staking Arrangements. Unitholders of the ETF will be meeting on or about August 20, 2025 to vote on the matter. Please see “*Specific Information about each of the Funds described in this Simplified Prospectus – What does the Fund Invest In? – How the Funds engage in Staking Arrangements*” for more details.

This document provides specific information about CI Ethereum Fund. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

As it is the ETF's intention to invest in ETH on a passive basis, the ETF's holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of ETH declines or is expected to decline. The ETF may also hold cash and cash equivalents or other money market instruments in order to meet its obligations.

The ETF does not intend to use derivatives in connection with its investment strategy. Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire ETH for its portfolio. The ETF may however borrow money on a temporary short-term basis to acquire ETH in connection with a subscription for the ETF units by a dealer. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

What are the Risks of Investing in the Fund?

During the 24-month period immediately preceding June 16, 2025, up to 100.00% of the net assets of the Fund were invested in units of CI Galaxy Ethereum ETF. What Does the Fund Invest In?

Investment Objective

The investment objective of the Fund is to provide unitholders exposure to Solana (“**SOL**”) through an institutional-quality fund platform.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the Fund will invest all or substantially all of its assets in CI Galaxy Solana ETF (the “**ETF**”), an alternative mutual fund within the meaning of NI 81-102.

The ETF will invest directly in SOL and will utilize high-quality service providers in the digital assets sector (e.g., digital asset custodians, trading platforms and trading counterparties) in order to manage the assets of the ETF. The ETF may also, subject to any required regulatory approval, stake SOL held in its portfolio in order to earn rewards for the ETF, which rewards will, following the deduction of applicable fees and expenses, accrue to the ETF’s NAV for the benefit of unitholders. The Manager intends to adopt a measured approach to Staking Arrangements, taking into account, amongst other factors, the liquidity needs of the ETF and intends to initially target staking up to 50% of the SOL held in the portfolio of the ETF. See “*Investment Strategy – Staking*”.

The ETF’s portfolio is priced based on, and the NAV of the ETF is calculated using, the Bloomberg Galaxy Solana Index (the “**SOL Index**”) or such other index as the Manager may select from time to time, in its discretion.

The SOL Index is designed to measure the performance of a single SOL traded in U.S. dollars. The SOL Index is calculated based on the time-weighted average price from eligible non-outlier trades that occur on eligible exchanges (as determined by Digital Asset Research, Inc.) between 3:30 pm EST to 4:00 pm EST. The SOL Index is

This document provides specific information about CI Solana Fund. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

owned and administered by Bloomberg Index Services Limited and is co-branded with the portfolio sub-adviser, Galaxy Digital Capital Management LP; however, the portfolio sub-adviser has no input into the pricing of the SOL Index.

In the event that the Manager determines that it is in the best interest of the ETF to select another pricing source for SOL held by the ETF from time to time, the Manager will, in selecting such alternative pricing source, have regard for the appropriateness and reliability of the data with particular regard for the adequacy of AML and KYC process protections and the protocols designed to address potential price manipulation.

Please note that the ETF intends to commence staking a portion of SOL held in the ETF's portfolio. Please see *"Specific Information about each of the Funds described in this Simplified Prospectus – What does the Fund Invest In? – How the Funds engage in Staking Arrangements"* for more details.

As the ETF invests in SOL on a passive basis, the ETF's holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of SOL declines or is expected to decline.

The ETF may also hold cash and cash equivalents or other money market instruments in order to meet its current obligations. The ETF does not intend to use derivatives in connection with its investment strategy and does not intend to pay cash distributions.

Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire SOL for its portfolio. The ETF may however borrow money on a temporary short-term basis to acquire SOL in connection with a subscription for units by a Dealer. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

What Does the ETF Invest In?

Investment Objective

The investment objective of the ETF is to provide unitholders exposure to bitcoin (“**BTC**”) through an institutional-quality fund platform.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the ETF will invest directly in BTC and will utilize high-quality service providers in the digital assets sector (e.g., digital asset custodians, trading platforms and trading counterparties) in order to manage the assets of the ETF.

The ETF’s portfolio is priced based on, and the NAV of the ETF is calculated using, the Bloomberg Galaxy Bitcoin Index (the “**BTC Index**”) or such other index as the Manager may select from time to time, in its discretion. The BTC Index is designed to measure the performance of a single BTC traded in U.S. dollars.

The BTC Index is calculated using Digital Asset Research fixings (“**DAR**”) as their primary input. DAR is a pricing algorithm using a time-weighted average price derived from eligible, non-outlier trades that occur within a 30-minute window prior to a specified close time. The Indexes are owned and administered by Bloomberg Index Services Limited and are co-branded with the portfolio sub-adviser, Galaxy Digital Capital Management LP; however, the portfolio sub-adviser has no input into the pricing of the BTC Index.

In the event that the Manager determines that it is in the best interest of an ETF to select another pricing source for the applicable Digital Asset held by the ETF from time to time, the Manager will, in selecting such alternative pricing source, have regard for the appropriateness and reliability of the data to be relied upon with particular regard for the adequacy of anti-money laundering (“**AML**”) and know-your-client (“**KYC**”) process protections and the protocols designed to address potential price manipulation.

As the ETF invests in BTC on a passive basis, the ETF’s holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of BTC declines or is expected to decline.

The portfolio sub-adviser executes all digital asset trading on behalf of the ETF pursuant to the terms of the portfolio sub-adviser agreement.

This document provides specific information about CI Galaxy Bitcoin ETF. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

BTC is purchased for the ETF in the over-the-counter market through counterparties approved by the portfolio sub-adviser. All trading counterparties must go through the portfolio sub-adviser's AML and KYC processes, which has been modeled on programs established under the U.S. Bank Secrecy Act.

The ETF may also hold cash and cash equivalents or other money market instruments in order to meet its current obligations. The ETF does not intend to use derivatives in connection with their investment strategies and do not intend to pay cash distributions.

Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire the applicable Digital Asset for their portfolios. The ETF may however borrow money on a temporary short-term basis to acquire BTC in connection with a subscription for units by a Dealer. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

The ETF's functional and presentation currency is in U.S. dollars and the investor's investment will be made in U.S. dollars (although the ETF and investors are required to compute their income and gains for Canadian tax purposes in Canadian dollars – see *"Income Tax Considerations"* in Part A of the simplified prospectus). The ETF will purchase the BTC which is currently denominated in U.S. dollars.

Currency Hedging in respect of ETF C\$ Hedged Series

It is intended that substantially all of the U.S. dollar currency exposure of the ETF's holdings attributable to the ETF C\$ Hedged Series will be hedged back to the Canadian dollar by using derivatives, including currency forward contracts. Hedging currency exposure to reduce the impact of fluctuations in the U.S. / Canadian dollar exchange rate is intended to reduce the direct exposure to currency risk for unitholders of ETF C\$ Hedged Series of the ETF. The currency hedging mandate applicable to units of the ETF C\$ Hedged Series shall not be changed by the Manager without first obtaining approval of unitholders of such series. Other than the foregoing, the ETF does not use derivatives.

What are the Risks of Investing in the ETF?

During the 24-month period immediately preceding June 16, 2025, up to 100.00% of the net assets of the ETF were invested in BTC. The associated risk is discussed in the section *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – General Risks – Concentration Risk"* in Part B of this simplified prospectus.

For a list of risk factors applicable to the ETF, please see *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Types of Risks"*.

Distribution Policy

Income and capital gains are distributed annually, if any, in December. For more information, see *"Description of the Units Offered by the Funds – Distribution Policy"*.

What Does the ETF Invest In?

Investment Objective

The investment objective of the ETF is to provide unitholders exposure to Ether (“**ETH**”) through an institutional-quality fund platform.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the ETF will invest directly in ETH and will utilize high-quality service providers in the digital assets sector (e.g., digital asset custodians, trading platforms and trading counterparties) in order to manage the assets of the ETF.

The ETF’s portfolio is priced based on, and the NAV of the ETF is calculated using, the Bloomberg Galaxy Ethereum Index (the “**ETH Index**”) or such other index as the Manager may select from time to time, in its discretion. The ETH Index is designed to measure the performance of a single ETH traded in U.S. dollars.

Each of the Indexes are calculated using Digital Asset Research fixings (“**DAR**”) as their primary input. DAR is a pricing algorithm using a time-weighted average price derived from eligible, non-outlier trades that occur within a 30-minute window prior to a specified close time. The Indexes are owned and administered by Bloomberg Index Services Limited and are co-branded with the portfolio sub-adviser, Galaxy Digital Capital Management LP; however, the portfolio sub-adviser has no input into the pricing of the ETH Index.

In the event that the Manager determines that it is in the best interest of an ETF to select another pricing source for the applicable Digital Asset held by the ETF from time to time, the Manager will, in selecting such alternative pricing source, have regard for the appropriateness and reliability of the data to be relied upon with particular regard for the adequacy of anti-money laundering (“**AML**”) and know-your-client (“**KYC**”) process protections and the protocols designed to address potential price manipulation.

As the ETF invests in ETH on a passive basis, the ETF’s holdings will not be actively managed and accordingly, will not be hedged or repositioned to attempt to take defensive positions if the price of ETH declines or is expected to decline.

The portfolio sub-adviser executes all digital asset trading on behalf of the ETF pursuant to the terms of the portfolio sub-adviser agreement.

This document provides specific information about CI Galaxy Ethereum ETF. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

ETH is purchased for the ETF in the over-the-counter market through counterparties approved by the portfolio sub-adviser. All trading counterparties must go through the portfolio sub-adviser's AML and KYC processes, which has been modeled on programs established under the U.S. Bank Secrecy Act.

The ETF may also hold cash and cash equivalents or other money market instruments in order to meet its current obligations. The ETF does not intend to use derivatives in connection with their investment strategies and do not intend to pay cash distributions.

Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire ETH for the ETF's portfolio. The ETF may however borrow money on a temporary short term basis to acquire ETH in connection with a subscription for units by a Dealer. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

The ETF's functional and presentation currency is in U.S. dollars and the investor's investment will be made in U.S. dollars (although the ETF and investors are required to compute their income and gains for Canadian tax purposes in Canadian dollars – see *"Income Tax Considerations"* in Part A of the simplified prospectus). The ETF will purchase ETH which is currently denominated in U.S. dollars.

Currency Hedging in respect of ETF C\$ Hedged Series

It is intended that substantially all of the U.S. dollar currency exposure of the ETF's holdings attributable to the ETF C\$ Hedged Series will be hedged back to the Canadian dollar by using derivatives, including currency forward contracts. What Does the ETF Invest In?

Investment Objective

The investment objective of the ETF is to provide unitholders with exposure to certain digital assets as selected by the Manager, with the weighting based on a modified market capitalization model.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the ETF will primarily invest in a mix of ETFs, managed by the Manager, that provide exposure to one or more digital assets, including, but not limited to, BTC, ETH and/or SOL.

The ETF does not intend to directly hold digital assets. The selection of digital assets for inclusion in the portfolio will be determined by the Manager, based on the availability of ETFs or investment funds managed by it. As of the date hereof, the ETF intends to invest in CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF and CI Galaxy Solana ETF, each of which is an ETF currently managed by the Manager. Where the ETF invests in another ETF or investment fund, no management fees or incentive fees are payable by the ETF that, to a reasonable person, would duplicate a fee payable by such other investment fund for the same service.

The Manager will utilize a model that incorporates static exposure to digital assets within the portfolio. With respect to the digital assets portfolio, the ETF intends to rebalance quarterly to a weighting of 70% CI Galaxy Bitcoin ETF, 15% CI Galaxy Ethereum ETF and 15% CI Galaxy Solana ETF or such other weighting as determined by the Manager from time to time.

The Manager has retained Galaxy Digital Capital Management LP to act as portfolio sub-adviser for the ETF and has delegated investment management duties.

The ETF may also invest a substantial portion of its assets in cash, cash equivalents or other money market instruments in order to meet its current obligations or for tactical purposes. The ETF does not intend to use derivatives in connection with its investment strategy and does not intend to pay cash distributions.

In the event of adverse market, economic or political conditions, the NAVs of CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF or CI Galaxy Solana ETF may decline, possibly resulting in the ETF investing all or substantially all of its assets in cash, cash equivalents or other money market instruments.

This document provides specific information about CI Galaxy Core Multi-Crypto ETF. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire certain digital assets for its portfolio. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

The ETF's functional and presentation currency is in U.S. dollars (although the ETF and investors are required to compute their income and gains for Canadian tax purposes in Canadian dollars – see *"Income Tax Considerations"* in Part A of the simplified prospectus).

Currency Hedging in respect of ETF C\$ Hedged Series

It is intended that substantially all of the U.S. dollar currency exposure of the ETF's holdings attributable to the ETF C\$ Hedged Series will be hedged back to the Canadian dollar by using derivatives, including currency forward contracts. Hedging currency exposure to reduce the impact of fluctuations in the U.S. / Canadian dollar exchange rate is intended to reduce the direct exposure to currency risk for unitholders of ETF C\$ Hedged Series of the ETF. The currency hedging mandate applicable to units of ETF C\$ Hedged Series shall not be changed by the Manager without first obtaining approval of unitholders of such series. Other than the foregoing, the ETF does not use derivatives.

What are the Risks of Investing in the ETF?

For a list of risk factors applicable to the ETF, please see *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Types of Risks"*.

What Does the ETF Invest In?

Investment Objective

The investment objective of the ETF is to provide unitholders with managed exposure to certain digital assets as selected by the Manager, using a rules-based momentum signaling strategy.

Any change to the fundamental investment objective must be approved by a majority of the votes cast at a meeting of unitholders held for that reason.

Investment Strategies

To achieve its investment objective, the ETF will primarily invest in a mix of ETFs, managed by the Manager, that provide exposure to one or more digital assets, including, but not limited to, BTC, ETH and/or SOL.

The ETF does not intend to directly hold digital assets. The selection of digital assets for inclusion in the portfolio will be determined by the Manager, based on the availability of ETFs or investment funds managed by it. As of the date hereof, the ETF intends to invest in CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF and CI Galaxy Solana ETF each of which is an ETF currently managed by the Manager. Where the ETF invests in another ETF or investment fund, no management fees or incentive fees are payable by the ETF that, to a reasonable person, would duplicate a fee payable by such other investment fund for the same service.

The Manager will utilize a model that incorporates moving averages to signal positive or negative momentum as an indicator to increase or decrease exposure to digital assets within the portfolio. With respect to the digital assets portfolio, the ETF intends to rebalance quarterly to a weighting of 50% CI Galaxy Bitcoin ETF, 25% CI Galaxy Ethereum ETF, 25% CI Galaxy Solana ETF or such other weighting as determined by the Manager from time to time.

The Manager has retained Galaxy Digital Capital Management LP to act as portfolio sub-adviser for the ETF and has delegated investment management duties.

The ETF may also invest a substantial portion of its assets in cash, cash equivalents or other money market instruments based on negative momentum signals from the rules-based strategy or in order to meet its current

This document provides specific information about CI Galaxy Multi-Crypto Navigator ETF. It should be read in conjunction with the rest of the simplified prospectus of the CI Alternative Funds dated July 15, 2025. This document and the document that provides general information about the funds together constitute the simplified prospectus.

obligations or for tactical purposes. The ETF does not intend to use derivatives in connection with its investment strategy and does not intend to pay cash distributions.

In the event of adverse market, economic or political conditions, the NAVs of CI Galaxy Bitcoin ETF, CI Galaxy Ethereum ETF or CI Galaxy Solana ETF may decline, possibly resulting in the ETF investing all or substantially all of its assets in cash, cash equivalents or other money market instruments.

Generally, the ETF does not intend to borrow money or employ other forms of leverage to acquire certain digital assets for its portfolio. Any borrowing by the ETF will be made in accordance with the borrowing restrictions applicable to an alternative mutual fund under NI 81-102.

The ETF's functional and presentation currency is in U.S. dollars (although the ETF and investors are required to compute their income and gains for Canadian tax purposes in Canadian dollars – see *"Income Tax Considerations"* in Part A of the simplified prospectus).

Currency Hedging in respect of ETF C\$ Hedged Series

It is intended that substantially all of the U.S. dollar currency exposure of the ETF's holdings attributable to the ETF C\$ Hedged Series will be hedged back to the Canadian dollar by using derivatives, including currency forward contracts. Hedging currency exposure to reduce the impact of fluctuations in the U.S. / Canadian dollar exchange rate is intended to reduce the direct exposure to currency risk for unitholders of ETF C\$ Hedged Series of the ETF. The currency hedging mandate applicable to units of ETF C\$ Hedged Series shall not be changed by the Manager without first obtaining approval of unitholders of such series. Other than the foregoing, the ETF does not use derivatives.

What are the Risks of Investing in the ETF?

During the 24-month period immediately preceding June 16, 2025, up to 25.80%, 50.15%, and 58.98% of the net assets of the ETF were invested in units of CI Galaxy Solana ETF, CI Galaxy Ethereum ETF, and CI Galaxy Bitcoin ETF, respectively. The associated risk is discussed in the section *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – General Risks – Concentration Risk"* in Part B of this simplified prospectus.

For a list of risk factors applicable to the ETF, please see *"What is a Mutual Fund and What are the Risks of Investing in a Mutual Fund? – Types of Risks"*.

Distribution Policy

Income and capital gains are distributed annually, if any, in December. For more information, see *"Description of the Units Offered by the Funds – Distribution Policy"*.
